KEY TO PRONUNCIATION.

a as in fat, man, pang.
 ā as in fate, mane, dale.
 ä as in far, father, guard.
 å as in fall, talk, naught.
 ă as in ask, fast, ant.
 â as in fare, hair, bear.
 e as in met, pen, bless.
 ē as in mete, meet, meat.
 é as in her, fern, heard.
 i as in pin, it, biscuit.
 ī as in pine, flight, file.

 ō as in note, poke, floor.
 ô as in move, spoon, room.
 ô as in nor, song, off.
 u as in tub, son, blood.
 ū as in mute, acute, few (also new, tube, duty: see Preface, pp. ix, x).

û as in pull, book, could.
 ü German ü, French u.
 oi as in oil, joint, boy.
 ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ā as in prelate, courage, captain.
 ē as in ablegate, episcopal.
 ô as in abrogate, eulogy, democrat.
 ū as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that,

even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *u*-sound (of but, pun, etc.). See Preface, p. xi. Thus:

ā as in errant, republican.
 ē as in prudent, difference.
 i as in charity, density.
 o as in valor, actor, idiot.
 ū as in Persia, peninsula.
 ū as in the book.
 ū as in nature, feature.

A mark (˘) under the consonants *t*, *d*, *s*, *z* indicates that they in like manner are variable to *ch*, *j*, *sh*, *zh*. Thus:

† as in nature, adventure.
 ‡ as in arduous, education.
 § as in leisure.
 z as in seizure.

th as in thin.
 TH as in then.
 ch as in German ach, Scotch loch.
 n French nasalizing n, as in ton, en.
 ly (in French words) French liquid (mouillé) l.
 ' denotes a primary, " a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read *from*; i. e., derived from.
 > read *whence*; i. e., from which is derived.
 + read *and*; i. e., compounded with, or with suffix.
 = read *cognate with*; i. e., etymologically parallel with.
 √ read *root*.
 * read *theoretical or alleged*; i. e., theoretically assumed, or asserted but unverified, form.
 † read *obsolete*.

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus:

back¹ (bak), *n*. The posterior part, etc.
 back¹ (bak), *a*. Lying or being behind, etc.
 back¹ (bak), *v*. To furnish with a back, etc.
 back¹ (bak), *adv*. Behind, etc.
 back² (bak), *n*. The earlier form of *bat*.
 back³ (bak), *n*. A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for *number*, "st." for *stanza*, "p." for *page*, "l." for *line*, ¶ for *paragraph*, "fol." for *folio*. The method used in indicating the subdivisions of books will be understood by reference to the following plan:

Section only § 5.
 Chapter only xiv.

Canto only	xiv.
Book only	iii.
Book and chapter	} iii. 10.
Part and chapter	
Book and line	
Book and page	
Act and scene	} II. 34.
Chapter and verse	
No. and page	
Volume and page	
Volume and chapter	IV. iv.
Part, book, and chapter	II. iv. 12.
Part, canto, and stanza	II. iv. 12.
Chapter and section or ¶	vii. § or ¶ 8.
Volume, part, and section or ¶	I. i. § or ¶ 6.
Book, chapter, and section or ¶	I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discriminated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [*cap.*] for "capital" and [*l. c.*] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoological and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoology, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoological and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

Conocephalus (kō-nō-sef'ā-lus), *n.* [NL., < Gr. *κῆνος*, a cone, + *κεφαλή*, a head.] 1. A surface generated by a right line which constantly crosses a fixed right line at right angles, and also constantly intersects the circumference of a fixed circle.

conodont (kō'nō-dont), *n.* [Gr. *κῶνος*, a cone, + *ὀδὸν* (odont-) = *E. tooth*.] A small glistening fossil organism, discovered by Pander in Silurian and Devonian rocks in Russia, and subsequently observed in other strata in different localities, and variously supposed to be a tooth of a cyclostomous fish, or a spine, hooklet, or denticle of a mollusk or an annelid: so named from its conical tooth-like appearance. These organisms are certainly not teeth of any vertebrates, and are probably the remains of worms.

Conodonts, supposed to belong to the Myxiniidae, are minute paleozoic tooth-like fossils.

If the conic section is a parabola, the resulting solid is a paraboloid conoid, or paraboloid; if a hyperbola, the solid is a hyperbolic conoid, or hyperboloid; if an ellipse, an elliptic conoid, a spheroid, or an ellipsoid. But the term *conoid* is often used to include the hyperboloids and paraboloids and to exclude the spheroids. This is the meaning of the Greek word with Archimedes. (*b*) A skew surface which may be generated by a straight line moving in such a manner as to touch a straight line and curve, and continue parallel to a given plane. (*c*) A surface generated by the revolution of an arc of a circle about its sine.—2. In *anat.*, the conarium or pineal body.

The 4 tentaculocysts are periradial; the lamelliform genitalia are in 4 pairs, attached to 4 interradial septa dividing the enteric cavity into 4 gastric pouches, in which the genitalia hang freely. There are 4 interradial flaps, bearing each a long tentacle, and a broad vascular false velum penetrated by the enteric canals.

conomedusan (kō'nō-mē-dū'san), *a.* and *n.* [Conomedusæ + -an.] 1. *a.* Pertaining to or having the characters of the *Conomedusæ*; charybdean.

Hence *conquest*, etc.] I. trans. 1. To overcome the resistance of; compel to submit or give way; gain a victory over; subdue by force of arms, or by superior strength or power of any kind: as, to *conquer* the enemy in battle, or an antagonist in a prize-fight; to *conquer* a stubborn will, or one's passions.

=Syn. 1 and 3. *Overcome*, *Vanquish*, *Conquer*, *Subdue*, *Subjugate*, to overpower, overthrow, defeat, beat, rout, worst, discomfit, humble, crush, subject, master, agree in the general idea expressed by *overcome*, namely, that of becoming superior to by an effort. The most conspicuous use of these words is in relation to physical struggles, as in war, wrestling, etc., but they refer also to struggles of mind, as in statesmanship, debate, chess, etc. An important difference among them is the implied duration of the victory, *overcome* and *vanquish* not reaching beyond the present, *conquer* implying a good deal of permanence, and *subdue* and *subjugate* containing permanence as an essential idea. *Overcome* is not so strong as *vanquish*, the former expressing a real victory, but the latter also a complete or great one. *Conquer* is wider and more general than *vanquish*, and may imply a succession of struggles or conflicts, while *vanquish* and *overcome* refer more commonly to a single conflict. Alexander the Great *conquered* Asia in a succession of battles, and *vanquished* Darius in one decisive engagement. In this respect *subdue* and *subjugate* are like *conquer*. *Subdue* may express a slower, quieter process than *conquer*. *Subjugate* is the strongest; it is to bring completely under the yoke. See *defeat*.

Who overcomes

II. intrans. To make a conquest; gain the victory.

Specifically—2. *Eccles.*: (*a*) The act of conferring upon a priest the powers and authority of a bishop; the rite or ceremony of elevation to the episcopate. In the Roman Catholic, in the Greek and other Oriental churches, and in the Anglican Church, imposition of hands by a bishop for the purpose of making the candidate a bishop is held to be essential to consecration, and the rule is that at least three bishops shall unite in the act, as directed by the fourth canon of the first Council of Nicaea, *a. d.* 325.

Only papal authority could loose the tie that bound the bishop to the church of his consecration.

Stubbs, Const. Hist., § 383.

According to the Roman Catholic and the Anglican Church the essential act of eucharistic consecration consists in the recital of the words of institution over the elements by a priest. In its fullest form it consists of three parts: (1) the institution; (2) the oblation, called distinctively the great oblation; and (3) the epiclesis or invocation. It was customary to consecrate each of these crosses with chrism, and to recite a special prayer, and perhaps to incense each one; in some cases the cross was cut subsequently in a place which the officiant had consecrated in this manner. In the Greek

Church three larger crosses are cut upon the altar-slab instead of five, and the pillars supporting the altar also receive crosses. See *altar-board*.

Also called *parallel intervals*. Consecutive thirds and sixths are agreeable; consecutive fourths, disagreeable; while consecutive perfect fifths or octaves (or unisons) are usually forbidden. Consecutive fifths and octaves (or unisons) are covered or hidden when the fifth or octave is reached by similar but not parallel motion; such progressions are rarely objectionable, except when occurring between the outer, most conspicuous voices, and not then if one of

Thus, the tangent to a curve at a node is said to meet the curve in three coincident points, of which two are not only coincident, but (what is more than coincident) consecutive. This means that a right line cutting the curve in three points may by a continuous motion be brought into coincidence with the tangent at the node, and the three points in this motion running up into one, and the motion of two of them being, at the limit, entirely along the tangent.—**Consecutive poles**, in *magnetism*. Pop. Sci. Mo., XXVIII. 540.

Consensual contract, in *civil law*, a contract which, though made without the formalities of delivery, writing, or entry in account, was enforceable on the ground that in cases of sale, partnership, agency, and hiring proof of the consent of the parties was enough.

The term *Consensual* merely indicates that the obligation is here annexed at once to the *Consensus*. The *Consensus*, or mutual assent of the parties, is the final and crowning ingredient in the Convention; and it is the special characteristic of agreements falling under one of the four heads of Sale, Partnership, Agency, and Hiring, that, as soon as the assent of the parties has supplied this ingredient, there is at once a *Contract*. The *Consensus* draws with it the obligation, performing, in transactions of the sort specified, the exact functions which are discharged, in other contracts, by the Res or Thing, by the Verba stipulationis, and by the Littere or written entry in a ledger. *Consensual* is therefore a term which does not involve the slightest anomaly, but is exactly analogous to Real, Verbal, and Literal.

8. In law, that which a contracting party accepts as an equivalent for a service rendered; the sum or thing given, or service rendered, in exchange for something else, or the sum, thing, or service received in exchange for something; the price of a promise or a transfer of property.

This may consist either in a benefit to the promisor or a burden assumed by the promisee, or both. A contract must be mutual, and one side is the consideration of the other. A promise made without any such counter compensation or equivalent may be binding in morals, but the law does not recognize it as a contract nor compel its performance. It is not essential that a consideration be an equivalent in a commercial sense, nor even that it have any commercial value. Even exoneration from a moral obligation which could not be enforced at law may be a consideration for an express promise to perform it: thus, where a debtor, after a legal discharge in bankruptcy or by the statute of limitations, without having paid anything, recognizes his moral obligation to pay, and makes an express promise to do so, the moral obligation is deemed a sufficient consideration to make the promise a legal contract.—**Concurrent consideration**, a consideration received contemporaneously with the making of the promise.—**Executed consideration**, a consideration previously received.—**Executory consideration**, a consideration that was to be received subsequently to the making of the promise.—**Failure of consideration**, resulting worthlessness or inadequacy of a consideration originally apparently good: distinguished from *want of consideration* (which see, below).—**Good consideration**, the natural love or affection, or other adequate motive, on account of which a benefit is conferred without a valuable equivalent. Such a consideration is generally sufficient, except as against creditors.—**Valuable consideration**, in law, a consideration which may be deemed valuable in a pecuniary sense, as money, goods, services, or the promise of either. Actual marriage may also be a valuable consideration.—**Want of consideration**, original lack of any consideration whatever.—**Syn.** 1 and 2. Attention, reflection.

The perfect consonances are the unison, the octave, the fifth, and the fourth; the imperfect are the major and minor thirds and the major and minor sixths. The effect of consonances is due to the simplicity of the ratio between the vibration-numbers of their constituent tones. Thus, the ratio of the unison is 1; of the octave, 2; of the fifth, 3; of the fourth, 4; of the major sixth, 5; of the major third, 6; of the minor third, 7; of the minor sixth, 8. II. *n.* An alphabetic element other than a vowel; one of the closer, less resonant and continuous, of the sounds making up a spoken alphabet; an articulate utterance which is combined, to form a syllable, with another opener utterance called a vowel. Consonants are the closer, and vowels the opener, of the sounds that make up the alphabetic scale or system of a language. But there is no absolute line of distinction between the two classes; and the openest of the consonants may be and are used as vowels also. Thus, the same *t*-sound is consonant in *apple*, and vowel in *burden*; and in some languages, as Sanskrit and Polish, *r* is much used as a vowel. On the other hand, *y* and *v* are hardly, if at all, distinguishable from *e* and *o*. Such consonants, as standing near the boundary between consonant and vowel, are often called *semi-vowels* (also *liquids*). According to their degree of closeness, consonants are divided into *mutes* (or *stops*, or *explosives*), as *b* and *p*, which involve a complete cutting off of the passage of the breath; *fricatives* (*spirants* and *sibilants*, etc.), as *th* and *dh* (TH), *f* and *v*, and *s* and *z*, in which a rustling or friction of the breath through a nearly closed position of the organs is the conspicuous element; *nasals*, as *n*, *m*, and *ng*, accompanied with admission of the in-taken breath to the nose and its resonance there; and *semi-vowel* or *liquid* sounds, as already illustrated. According to the organs used in producing them, they are divided into *labials*, made with the lips, as *p*, *b*, *f*, *v*, *m*; *dentals* or *linguals*, made with the tip of the tongue at or near the teeth, as *t*, *d*, *th*, *dh* (TH), *n*; *palatals* or *gutturals*, made with the back of the tongue, as *k*, *g*, *ng*; and some languages have various other classes. Then, according as they are made with simple breath, or with breath vocalized or made sonant in the larynx, they are divided into *voiced* or *breathed*, as *p*, *t*, *f*, *s*, etc., and *sonant* or *voiced* or *sonant*, as *b*, *d*, *v*, *z*, etc. (sometimes wrongly distinguished as *hard* and *soft*, as *strong* and *weak*, as *sharp* and *flat*, and so on.) See these various terms, and *syllable*.

constabulus, constabulus, constabulis, constabitis, constabulus, constabitis, constabuli, a constable (in various uses), orig. comes stabuli, lit. 'count of the stable,' master of the horse: L. comes, a follower, etc.; stabuli, gen. of stabulum, a stable: see count² and stable².] 1. An officer of high rank in several of the medieval monarchies. The Lord High Constable of England was the seventh officer of the crown. He had the care of the common peace in deeds of arms and matters of war, being a judge of the court of chivalry, or court of honor. To this officer, and to the earl marshal, belonged the cognizance of contracts touching deeds of arms without the realm, and combats and blazonry within the realm. His power was so great, and was often used to his improper ends, that it was abridged by the 13th Richard II., and was afterward forfeited in the person of Edward Stafford, Duke of Buckingham, in the reign of Henry VIII. It has never been granted to any person since that time, except on a particular occasion. The office of Lord High Constable of Scotland is one of great antiquity and dignity. He had formerly the command of the king's armies while in the field, in the absence of the king. He was likewise judge of all crimes or offenses committed within four miles of the king's person, or within the same distance of the parliament or of the privy council, or of any general convention of the states of the kingdom. The office has been hereditary since 1314 in the family of Hay, earls of Erroll, and is expressly reserved in the treaty of union. The Constable of France was the first officer of the kings of France, and ultimately became commander-in-chief of the army and the highest judge in all questions of chivalry and honor. This office was suppressed in 1627. Napoleon reestablished it during a few years, in favor of his brother Louis Bonaparte. The constable of a castle was the keeper or governor of a castle belonging to the king or a great noble. This office was often hereditary; thus, there were constables or hereditary keepers of the Tower, of Normandy, and of the castles of Windsor, Dover, etc.

The constabill of gude Duned,
The vanguard led before them all.
Battle of Harlaw (Child's Ballads, VII. 185).

The Constables of France repeatedly shook or saved the French throne. *Maine, Early Hist. of Institutions, p. 139.*

2. An officer chosen to aid in keeping the peace, and to serve legal process in cases of minor importance. In England constables of hundreds, or high constables (now in many districts called chief constables), are appointed either at quarter-sessions or by the justices of the hundred out of sessions; petty constables, or constables of tithings, are annually sworn into the office at quarter-sessions for each parish, upon presentment of the vestry, and are subordinate to the high or chief constables. In the United States the constable is an official of a town or village, elected with the other local officers, or, as a special constable, acting under a temporary appointment. The constable was formerly of much more consequence both in England and the colonies, being the chief executive officer of the parish or town.

The constable was formerly the chief man in the parish, for then the parish was responsible for all robberies committed within its limits if the thieves were not apprehended. . . . But this state of things has long passed away; . . . and although constables are in some few instances still appointed, their duties are almost entirely performed by the county police. And it was provided by an Act of 1872 that for the future no parish constable should be appointed unless the County Quarter Session or the Vestry should determine it to be necessary.

A. Fonblanque, Jr., How we are Governed, p. 69.

See above, 2.—**Parish constable.** In England, a petty constable exercising his functions within a given parish.—**Special constable,** a person sworn to aid the constituted authorities, military or civil, in maintaining the public peace on occasions of exigency, as to quell a riot.—**To outrun the constable.** (a) To escape from the subject in dispute when one's arguments are exhausted. *S. Butler.* (b) To live beyond one's means. In this latter sense also *outrun the constable.* [Colloq.]

"Harkee, my girl, how far have you overrun the constable?" I told him that the debt amounted to eleven pounds, besides the expense of the writ.

Smollett, Roderick Random, xxiii.

Poor man! at th' election he threw, 't'other day,
All his victuals, and liquor, and money away;
And some people think with such haste he began,
That soon he the constable greatly outran.

II. n. That which is not subject to change; something that is always the same in state or operation, or that continually occurs or recurs.

Quarterly Rev., CLXII. 44.

Specifically.—(a) *In math.*, a quantity which is assumed to be invariable throughout a given discussion; in the differential calculus, a quantity whose value remains fixed while others vary continuously. Although the constants do not vary by the variation of those quantities that are at first considered as variables, some or all of them may be conceived to vary in a second kind of change, called the *variation of constants*. A quantity which upon one supposition would remain constant becomes variable by the introduction of another supposition. Thus, taking into account the earth's attraction only, the longitude of the moon's node is constant, but by the attraction of the sun and planets its place is slowly changed. In this case one of the constants is said to *vary*. In algebra the unknown quantities are considered as *variables*, the known quantities and coefficients as *constants*. (b) *In physics*, a numerical quantity, fixed under uniform conditions, expressing the value of one of the physical properties of a certain substance. Thus, the *physical constants* of ice are the values of its specific gravity, melting-point, coefficient of expansion, index of refraction, electrical conductivity, etc. Similarly, in the case of a physical instrument a *constant* is a fixed value depending upon its dimensions, etc. Thus, the constant of a tangent galvanometer is the radius of its coil divided by the number of coils into 6.28318+.

The strength of a current may be determined in "absolute" units by the aid of the tangent galvanometer if the *constants* of the instrument are known.

S. P. Thompson, Elect. and Mag., p. 166.

See *arbitrary*.—**Circular constant.** See *circular*.—**Constant of aberration**, that one constant by the determination of which the aberration is obtained from its known laws at any given time.—**Constant of integration**, the new unknown constant which has to be introduced into every result of mathematical integration.—**Constants of color.** See *color*, 1.—**Gravitation constant**, the absolute modulus of gravitation, the acceleration per unit of time produced by the gravitating attraction of a unit mass at the unit of distance. The gravitation constant is about 0.0000000658 of a c. g. s. unit.—**Indeterminate constant**, a constant the value of which is unsettled, and which therefore differs from a variable only in not being regarded under that aspect.

Howells, Venetian Life, xxi.

Constantinopolitan Council, one of the several church councils held at Constantinople. The most famous of these are three general or ecumenical councils, namely: the second general council, under Theodosius, in A. D. 381, which condemned Macedonianism, authorized the creed commonly called the Nicene, and gave honorary precedence to the see of Constantinople next after that of Rome; the fifth general council, under Justinian, in 553, which condemned the Nestorian writings known as "the Three Chapters," and the Origenists; and the sixth general council, under Constantine Pogonatus, 680, against Monothelism, celebrated for its condemnation of Pope Honorius. The Roman Catholics also regard as ecumenical the eighth council, held in 869. The council commonly known as the Quinisext, because regarded as complementary to the fifth and sixth councils, was held at Constantinople under Justinian II. in 691, in the trullus or domed banquet-hall of the palace, from which it was also called the Trullan Council. Its canons are received by the Greek Church, and were confirmed by the second Nicene Council. A council held at Constantinople under Constantine Copronymus in 754, favoring the Iconoclasts, claimed to be ecumenical, but its decrees were reversed by the second Nicene Council in 787. See *council*, 7.—**Constantinopolitan creed.** See *Nicene*.—**Constantinopolitan liturgy.** See *liturgy*.

See *asterism*. Forty-eight constellations are mentioned in the ancient catalogue of Ptolemy, the majority of which appear to date from 2100 B. C. or earlier. They are distributed as follows: (1) North of the zodiac: *Ursa Minor* (the Little Bear, said to be formed by Thales, probably from the Dragon's wing), *Ursa Major* (the Great Bear, the Wain, or the Dipper), *Draco* (the Dragon), *Cepheus*, *Bootes* (the

Bear-keeper or Plowman), Corona Borealis (the Northern Crown), Hercules (in the original the Man Kneeling), Lyra (the Harp), Cygnus (the Swan, in the original the Bird), Cassiopeia (the Lady in the Chair), Perseus, Auriga (the Charioteer or Wagoner), Ophiuchus or Serpentarius (the Serpent-bearer), Serpens (the Serpent), Sagitta (the Arrow), Aquila et Antinous (the Eagle and Antinous), Delphinus (the Dolphin), Equulus or Equuleus (the Colt or the Horse's Head), Pegasus or Equus (the Horse), Andromeda, Triangulum Boreale (the Northern Triangle), (2) In the zodiac: Aries (the Ram), Taurus (the Bull), Gemini (the Twins), Cancer (the Crab), Leo (the Lion), Virgo (the Virgin), Libra (the Balance), Scorpius or Scorpion (the Scorpion), Sagittarius (the Archer), Capricornus (Capricorn, or the Goat), Aquarius (the Water-bearer), Pisces (the Fishes), (3) South of the zodiac: Cetus (the Whale), Orion, Eridanus or Fluvius (the River Po or the River), Lepus (the Hare), Canis Major (the Great Dog), Canis Minor (the Little Dog), Argo Navis (the Ship Argo), Hydra, Crater (the Cup), Corvus (the Crow or Raven), Centaurus (Centaur), Lupus (the Wolf), Ara (the Altar), Corona Australis (the Southern Crown), Piscis Australis (the Southern Fish), Coma Berenices (the Hair of Berenice) is an ancient asterism, which was not reckoned as a constellation by Ptolemy. Antinous, mentioned by Ptolemy as part of the constellation Aquila, is said to have been made a separate constellation by Firmicus in the fourth century. Crux (the Crozier or Southern Cross) appears to be mentioned by Dante. The navigators of the sixteenth century added a number of southern constellations. Twelve of these appear in the important star-atlas of Bayer (A. D. 1603), namely: Apus (the Bird of Paradise), Chamaeleon, Dorado (the Goldfish; or Xiphias, the Swordfish), Grus (the Crane), Hydrus (the Watersnake), Indus (the Indian Man), Musca or Apis (the Fly or the Bee), Pavo (the Peacock), Phoenix, Triangulum Australe (the Southern Triangle), the Toucan (also called Anser Americanus), and Volans (the Flying-fish). Columba (the Dove of Noah) was made by Petrus Plancius early in the sixteenth century. Bartschius in 1624 added several constellations, of which Camelopardalis (the Camelopard) and Monoceros (the Unicorn) are retained by modern astronomers. Hevelius in 1680 added Canes Venatici (the Greyhounds), Lacerta (the Lizard), Leo Minor (the Small Lion), Lynx (the Lynx), Scutum Sobieski (the Shield of Sobieski), Sextans (the Sextant), and Vulpecula et Anser (the Fox and the Goose). Finally, Lacaille in 1752 added Antlia Pneumatica (the Air-pump), Caelum (the Gravel), Circinus (the Compass), Fornax (the Furnace), Horologium (the Clock), Mons Mensae (the Table-mountain), Microscopium (the Microscope), Norma (the Quadrant), Octans (the Octant), Equus Pictorius (the Painter's Easel), Reticulum (the Net), Sculptor, and Telescopium (the Telescope). The ancient constellation Argo was broken up by Lacaille into the Stern, the Keel, the Sail, and the Mast. There are, thus, eighty-five constellations now recognized. The names of the constellations are mostly derived from Greek and Roman mythology. The practice of designating by the letters of the Greek alphabet (α, β, γ , etc.) the stars which compose each constellation, in the order of their brilliancy, originated with Bayer.

Without a constitution—something to counteract the strong tendency of government to disorder and abuse, and to give stability to political institutions—there can be little progress or permanent improvement. *Calhoun, Works, I. 11.*

A federal constitution is of the nature of a treaty. It is an agreement by which certain political communities, in themselves independent and sovereign, agree to surrender certain of the attributes of independence and sovereignty to a central authority, while others of these attributes they keep in their own hands. *E. A. Freeman, Amer. Lects., p. 190.*

4. A particular law, ordinance, or regulation, made by the authority of any superior, civil or ecclesiastical; specifically, in *Rom. law*, what an emperor enacted, either by decree, edict, or letter, and without the interposition of any constitutional assembly: as, the *constitutions of Justinian*.

Constitutions (constitutiones), properly speaking, are those Apostolic letters which ordain, in a permanent manner, something for the entire church or part of it. *H. B. Smith, Elem. Eccles. Law (5th ed.), I. 26.*

Of the canons and constitutions made in these [English ecclesiastical] assemblies, many have come down to our own times. These form a kind of national canon law. . . . They are principally taken up in such matters as peculiarly belonged to the . . . consideration of a national assembly of the clergy. *Reeves, Hist. Eng. Law (Finlason, 1880), II. 340.*

5. Any system of fundamental principles of action: as, the New Testament is the moral constitution of modern society.—*Apostolic Constitutions*. See *apostolic*.—*British Constitution*, a collective name for the principles of public policy on which the government of the United Kingdom of Great Britain and Ireland is based. It is not formulated in any particular document or set of documents, but is the gradual development of the political intelligence of the English people, as embodied in concessions forced from unwilling sovereigns, in the results of various revolutions, in numerous fundamental enactments of Parliament, and in the established principles of the common law. The character of the government has become increasingly democratic, and the power of the sovereign, great in the time of the Tudors, Stuarts, and earlier, is now much abridged. The controlling force in the movement has been the gradually acquired supremacy of Parliament (now residing almost entirely in the House of Commons) over the executive powers of government, so that the principal function of the sovereign is now that of simple confirmation. The chief monuments of the British Constitution, as a growth of liberal representative government, are the Magna Charta and its successive extensions, the Habeas Corpus Act, and the Bill of Rights, the principles of which have been incorporated in all the written constitutions of the English-speaking race. (See these terms.)—*Constitution coin*, a German coin struck according to the Leipzig rate of coinage, 8 rix-dollars weighing a Cologne mark of silver, 14 loths 4 grains fine, and 13½ florins weighing one mark, 12 loths fine. This rate, adopted by some states in 1690, was established throughout the empire from 1738 to 1763.—*Constitution of the United States, or Federal Constitution*, the fundamental or organic law of the United States. It was framed by the Constitutional Convention which met in Philadelphia May 25th, 1787, and adjourned September 17th, 1787, and it went into effect March 4th, 1789 (although Washington, the first president under it, was not inaugurated till April 30th), having been ratified by eleven of the thirteen States, the others, North Carolina and Rhode Island, ratifying it November 21st, 1789, and May 29th, 1790, respectively. It is a document comprised in seven original articles and fifteen amendatory articles, or amendments. Of the original articles, the first deals with the legislative body, prescribing the method of election to the House of Representatives and the Senate, the qualifications of members, the methods in which bills shall be passed, and those subjects on which Congress shall be qualified to act; the second relates to the executive department, prescribing the method of election and the qualifications and duties of the President; the third relates to the judicial department, providing for the supreme court and such inferior courts as Congress may think necessary; the fourth deals with the relations between the general government and the separate States, and provides for the admission of new

States; the fifth relates to the power and method of amendment to the Constitution; the sixth, to the national supremacy; and the seventh, to the establishment of the government upon the ratification of the Constitution by nine of the States. The amendments, according to one of the methods provided, were proposed by Congress and ratified by the States. The first twelve were submitted under acts passed in 1789–90, 1793, and 1803; the last three, after the civil war, under acts of 1865, 1868, and 1870. The most important of them are the twelfth, which changed the method of election of President and Vice-president; the thirteenth, which abolished slavery; the fourteenth, which disqualifies any one who has been engaged in rebellion against the government from holding office unless his disqualification be removed by Congress, and prevents the assumption and payment of any debt incurred in aid of rebellion; and the fifteenth, which prohibits the denial to any one of the right to vote because of race, color, or previous condition of servitude.—*Constitutions of Clarendon*, in *Eng. hist.*, certain propositions defining the limits of ecclesiastical and civil jurisdiction, drawn up at the Council of Clarendon, near Salisbury, held by Henry II., A. —3. Forming a part of, authorized by, or consistent with the constitution or fundamental organic law of a nation or state. According to him, the movements of a system of masses, however the masses may be connected together, take place at every moment in the utmost possible agreement with their free movement, and therefore under the least constraint. As measure of the constraint, is taken the sum of the products of every mass into the square of its departure from free motion.

azione, < NL. *consubstantiatio* (n.), < *consubstantiare*: see *consubstantiate*, v.] The doctrine that the body and blood of Christ coexist in and with the elements of the eucharist, although the latter retain their nature as bread and wine: opposed to the Roman Catholic doctrine of *transubstantiation*. The term *consubstantiation* was employed in the doctrinal controversies of the Reformation by non-Lutheran writers, to designate the Lutheran view of the Saviour's presence in the Holy Supper. The Lutheran Church, however, has never used or accepted this term to express her view, but has always and repeatedly rejected it, and the meaning it conveys, in her official declarations.

They [the Lutherans] believe that the real body and blood of our Lord is united in a mysterious manner, through the consecration, with the bread and wine, and are received with and under them in the sacrament of the Lord's supper. This is called *consubstantiation*. Hooker.

They, therefore, err, who say that we believe in impanation, or that Christ is in the bread and wine. Nor are those correct who charge us with believing subpanation, that Christ is under the form of bread and wine. And equally groundless is the charge of *consubstantiation*, or the belief that the body and blood of Christ are changed into one substance with the bread and wine. . . . But the Lutheran Church maintains that the Saviour fulfils his promise, and is actually present, especially present in the Holy Supper in a manner not comprehensible to us and not defined in the Scriptures. Actual contact; a touching; the state of being in contact, or within touching distance; hence, proximity of situation or place; contiguousness; adjacency.

Regard is justly had to *contiguity*, or adjacency, in private lands and possessions. *Bacon, Fable of Perseus*.

In a community of so great an extent as ours, *contiguity* becomes one of the strongest elements in forming party combinations, and distance one of the strongest elements in repelling them. *Cathoun, Works*, i. 233.

Some boundless *contiguity* of shade! *Cowper, The Task*, ii. 2.

3. In *psychol.*, the coexistence or immediate sequence of two or more impressions or experiences. The *law of contiguity* is that law of mental association according to which an idea which has been accompanied or followed by another is more likely to be accompanied or followed by that other on any occasion of reproduction, and that this tendency is stronger the oftener and the closer the *contiguity* of the ideas has been. The law also includes the tendency of ideas to recall ideas that have immediately preceded them—if there is such an elementary tendency, which is disputed. *Contiguity* is the most characteristic of the principles of association. It was stated by Aristotle, and was revived by David Hume, who used the word *contiguity* to translate Aristotle's term *τὸ συνεγχεύς*.

The qualities from which this association arises, and by which the mind is after this manner conveyed from one idea to another, are three, viz.: Resemblance, *Contiguity* in time or place, and Cause and Effect. *Hume, Treatise of Human Nature* (1739), i. § 4.

The *contiguity* in time and place must mean that of the sensations; and so far it is affirmed that the order of the ideas follows that of the sensations. *Contiguity* of two sensations in time means the successive order. *Contiguity* of two sensations in place means the synchronous order. *James Mill, Analysis of Human Mind*, iii.

Touching; meeting or joining at the surface or border; hence, close together; neighboring; bordering or adjoining; adjacent: as, two *contiguos* bodies, houses, or estates: usually followed by *to*.

A picturesque house *contiguos* to the churchyard, which in Queen Elizabeth's time was a palace and was visited by that sovereign, . . . has now become a dairy. *W. Winter, English Rambles*, p. 45.

Specifically—2. In *entom.*: (a) So thickly strewn as to be close together or touch, but without coalescing: as, *contiguos* spots, dots, or punctures. (b) Almost or quite touching at

the base: as, *contiguos* antennæ.—**Contiguous angles**. See *angle*, 1.—**Syn. Adjoining**, etc. See *adjacent*.

2. In a special sense, the restraint of the sexual passion within due bounds, whether absolute, as in celibacy, or within lawful limits, as in marriage; chastity.

It. continente*, *< L. continen(-t)s*, holding back, temperate, moderate, also hanging together, continuous, uninterrupted, ppr. of *continere*, hold back, check, also hold together; see *contain*. II. *n.* In def. II., 3, early mod. E. *continente* = *F. continent* = *Sp. Pg. It. continente* = *D. kontinent* = *G. kontinent*, *kontinent* = *Dan. kontinent*, *< ML. Great vessels into less are emptied never,
There's a redundancy past their *continent* ever. *Chapman, Revenge of Bussy d'Ambois*, ii. 1.

3. In *phys. geog.*, one of the largest land-masses of the globe. From the most general point of view there are two continental masses, the eastern and the western, the old world and the new world. In breaking these up into lesser divisions, Europe and Asia together naturally constitute one mass, conveniently designated as Eurasia, though each is commonly reckoned a separate continent. Africa, formerly attached to Asia very slightly by the isthmus of Suez, and now artificially severed from it by the Suez canal, forms another continental mass. Australia is regarded by many as a third continental subdivision of the eastern land-mass (or a fourth, reckoning Europe and Asia separately). North and South America form the two great natural subdivi-

sions (also separately called continents) of the western continent, and are hardly more united than were Africa and Asia before the cutting of the Suez canal.

4. [*cap.*] In a special sense, in English literature, the mainland of Europe, as distinguished from the British islands: as, to travel on the *Continent*.

[He] kindly communicated to her, as is the way with the best-bred English on their first arrival "on the *Continent*", all his impressions regarding the sights and persons he had seen. *Thackeray, Paris Sketch Book, A Caution to Travellers*.

But th' head fell backward on the *Continent*. *Spenser, F. Q.*, iii. v. 25.

Weary of solid firmness, melt itself
Into the sea! *Shak., 2 Hen. IV.*, iii. 1.

The army before Boston was designated as the *continental* army, in contradistinction to that under General Gates, which was called the ministerial army. *Irving*.

(b) Inclined to favor a strengthening of the general government and an increase of unity among the colonies.—**Continental climate**, in *phys. geog.*, the climate of a part of a continent, regarded as owing its peculiarities to this fact. Such a climate is subject to great fluctuations of temperature, both diurnal and seasonal. An insular climate, on the other hand, is much more equable. This difference is most marked in the case of a small island remote from all other land, as contrasted with the central portions of a great continental mass like Asia. Places near the sea, but more especially if surrounded by the sea, and in proportion as they are distant from the land, enjoy a more equable or insular climate. At a great distance from the sea, and especially if the land-area is very large, the summer is abnormally hot and the winter proportionally cold, while the difference between the temperatures of night and day is also very marked. The interiors of the continents have in general a smaller rainfall than their edges.—**Continental pronunciation**, or system of pronunciation of Latin and Greek. See *pronunciation*.

—**Continental system**, in *modern hist.*, the plan of the emperor Napoleon for excluding the merchandise of England from all parts of the continent of Europe. It was instituted by the decree of Berlin, issued November 21st, 1806, which declared the British islands in a state of blockade, and made prisoners of war all Englishmen found in the territories occupied by France and her allies.

II. *n.* 1. A native or an inhabitant of a continent, specifically of the continent of Europe.

2. In *Amer. hist.*, a soldier of the regular army of the revolted colonies in the war of independence.—**Not worth a continental**, not worth as much as a piece of paper money issued by the Continental Congress in the revolutionary war, and hence, from the depreciation of that money, of little or no value; worthless; good for nothing.

The quaint term "Continental" long ago fell into disuse, except in the slang phrase *not worth a continental*, which referred to the debased condition of our currency at the close of the Revolutionary War.

3†. A touching; a falling together; contact; as, "the point of contingency." *J. Gregory.*—Angle of contingency, the infinitesimal angle between two tangents to a curve at consecutive points.

Not existing or occurring through necessity; due to chance or to a free agent; accidentally existing or true; hence, without a known or apparent cause or reason, or caused by something which would not in every case act; dependent upon the will of a human being, or other finite free agent.

When any event takes place of which we do not discern the cause, [or] why it should have happened in this manner, or at this moment rather than another, it is called a contingent event, or an event without a cause: as, for example, the falling of a leaf on a particular spot, or the turning up of a certain number when dice are thrown.

2. In *math.* and *philos.*, a connection of points (or other elements) as intimate as that of the instants or points of an interval of time: thus, the *continuity* of space consists in this, that a point can move from any one position to any other so that at each instant it shall have a definite and distinct position in space. This statement is not, however, a proper definition of *continuity*, but only an exemplification drawn from time. The old definitions—the fact that adjacent parts have their limits in common (Aristotle), infinite divisibility (Kant), the fact that between any two points there is a third (which is true of the system of rational numbers)—are inadequate. The less satisfactory definition is that of G. Cantor, that *continuity* is the *perfect concatenation* of a system of points—words which must be understood in special senses. Cantor calls a system of points *concatenated* when any two of them being given, and also any finite distance, however small, it is always possible to find a finite number of other points of the system through which by successive steps, each less than the given distance, it would be possible to proceed from one of the given points to the other. He terms a system of points *perfect* when, whatever point not belonging to the system be given, it is possible to find a finite distance so small that there are not an infinite number of points of the system within that distance of the given point. As examples of a concatenated system, not perfect, Cantor gives the rational and also the irrational numbers in any interval. As an example of a perfect system not concatenated, he gives all the numbers whose expression in decimals, however far carried out, would contain no figures except 0 and 9.

The simplest of the Concrete Sciences, Astronomy and Geology, yield the idea of *continuity* with great distinctness. I do not mean *continuity* of existence merely; I mean *continuity* of causation: the unceasing production of effect—the never-ending work of every force. *H. Spencer*, Study of Sociol., p. 322.

[Chiefly an anatomical term, and especially a surgical one: as, the fracture of a bone in its *continuity*.]—**Continuity of forms**, in the Kantian *philos.*, the doctrine that if A and B are two concepts such that A includes the whole content of B and more, there will always be a third concept C, such that A includes the whole content of C and more, while C includes the whole content of B and more.—**Equation of continuity**, in *hydrodynamics*, the equation which expresses that any change in the quantity of fluid within any closed surface is, in the absence of sources or sinks within the surface, due to the flow of fluid through the surface. In its differential form the equation is

$$\frac{dp}{dt} + \frac{dpu}{dx} + \frac{dpv}{dy} + \frac{dpw}{dz} = 0,$$

where *t* is the time, *p* the density, *x, y, z* the rectangular coordinates, and *u, v, w* the corresponding components of the velocity.—**Law of continuity**, the doctrine that continuous changes in conditions will be accompanied by continuous changes in the results. This law was first set forth by Leibnitz in 1687, and employed to show that the properties of the parabola may be deduced from those of the ellipse, the laws of rest from those of motion, etc. Later he declared it applicable to such questions as whether there is an uninterrupted series of species from the highest to the lowest. The doctrine has often been understood as implying that there are no abrupt variations in nature.

From the knowledge of the complete state at any instant of a thing whose motion obeys the law of *continuity*, we can calculate where it was at any past time, and where it will be at any future time. *W. K. Clifford*, Lectures, I, 122.

Thus, a stem which has no joints is said to be *continuous*.—**Continuous bearings**, chains of timber laid under the rails of a railroad for their support, in place of stone or wooden sleepers fixed at certain intervals. The chains of timber, or longitudinal sleepers, are secured to cross-transoms fixed to piles.—**Continuous brake, girder, impost**, etc. See the nouns.—**Continuous function**, a function whose differential coefficient is nowhere infinite, so that an infinitesimal increment of the variable produces an infinitesimal increment in the value of the function.—**Continuous-service certificate**, a certificate issued to enlisted men in the United States navy who reenlist at the expiration of their term of service.—**Continuous voyage**. When the conformation of the ground or works is described by contours or horizontal sections, these sections are taken at some fixed vertical interval from each other suited to the scale of the drawing or the subject in hand; and the distances of the surface, at each interval, above or below some assumed plane of comparison, are given in figures at the most convenient places on the plan. (c) In *surv.*, a curve of equal elevation on a map; a contour-line. (d) In *math.*, a closed curve considered as enclosing an area.—**Area of a contour**. See *area*.—**Syn.** *Profile*, etc. See *outline*.

contour-line (kon-tōr'lin), *n.* In *surv.*, a line joining points of equal elevation on a surface; a line or level carried along the surface of a country or district at a uniform height above the sea-level. When laid down or plotted on a map or plan, such lines show the elevations and depressions of the surface of the ground, the degree of accuracy depending on the number of lines or levels taken. In the maps of the Coast and Geodetic Survey of the United States the contour-lines are generally given for every 20 feet of elevation. It is essential to the completeness of a contour-line that it should be carried on till it returns to the point whence it started, thus describing a closed curve. The littoral cordon or outline of the sea forms a natural contour-line. The system of representing the form of the earth's surface by means of horizontal lines at equal vertical distances was probably invented by Philippe Buache in 1744.

Contour-lines, eighty feet apart vertically, were run; and intermediate forty-foot contours were interpolated by means of slope-measurements in the steeper parts, and by running curves in the more level portions. Science, III. 365.

Contour-line map, a map in which the elevations are indicated by contour-lines, which may be drawn at any distance apart, according to the scale adopted and the accuracy with which the surveys have been made. Where the slope is steep the lines are more crowded together, and vice versa. This is, on the whole, the most advantageous method of representing topography where the scale adopted is large.

5. Specifically, in law, an interchange of legal rights by agreement. (a) In the most general sense, any agreement or obligation whereby one party becomes bound to another, whether by record or judgment, or by assent, or even impliedly, to do or to omit to do an act. In this sense it is used in contradistinction to obligations arising out of torts or wrongs. (b) The legal obligation resulting from the drawing together of minds until they meet in an agreement for the doing or the not doing of an act. In its narrowest use in this sense it implies an agreement where both parties become bound. *Contracts* of this sort are sometimes called *bilateral*, to distinguish them from *unilateral contracts*, which bind but one party. (c) An agreement in which a party undertakes to do or not to do an act. In this sense it includes *unilateral contracts*, such as promissory notes. (d) In the most strict sense, an agreement enforceable by law; an agreement upon sufficient consideration, and in such form, and made under such circumstances, that a breach of it is a good cause of action. In this sense it includes the idea of validity, as distinguished from those contracts which lack some element necessary to constitute a legal obligation. (e) In *civil law*, as defined by modern authors, the union of two or more persons resulting in an accordant declaration of the will, with the object of creating a future obligation between them. In the Pandects the generic word was *conventio*, and the word *contractus* was used for those particular conventions which were accompanied by such formalities as to fall within one of the classes recognized by the law as binding; the other conventions, the recognition of which was of later growth, and which were of imperfect effect, were called *pacta*.—**Accessory contract**, *aleatory contract*, *bare contract*, *commutative contract*, etc. See the adjectives.—**Contract of record**, a contract made and entered of record before a judicial tribunal, as a judgment, recognizance, etc.—**Executed contract**, a contract in respect of which the thing agreed has been done; a contract by or under which the possession of and right to the chose or thing are transferred together, as a deed conveying land.—**Executory contract**, a contract in respect of which the thing agreed remains yet to be done, as a contract to convey land at a future day. See *nominate contracts*, below.—**Joint contract**, a contract in which the contractors are jointly bound to perform the promise or obligation therein contained, or entitled to receive the benefit of such promise or obligation. *Bowley*.—**Literal contract**, in *Rom. law*, an agreement the validity of which was recognized by the tribunals provided the agreement was entered in the account-book of one, or it may have been of both, of the parties.—**Maritime contract**. J. Rousseau, which exercised a great influence in France and elsewhere previous to the revolution.—**Special contract.** (a) A sealed contract. (b) A written contract specifying in detail what is to be done, as a building-contract with specifications.—**To count on contract.** See *count*.—**Verbal contract.** a contract made by word of mouth, in contradistinction to one embodied in writing. ing or shrinking into a smaller compass or length: as, *contractile* muscles or fibers.—2. Producing contraction; capable of shortening or making smaller.

Specifically—3. In *entom.*, capable of being doubled in close to the lower surface of the thorax, and fitting into grooves so as to be hardly distinguishable from the general surface: said of the legs, etc., of insects. This structure is found in many *Coleoptera* which feign death on being alarmed. The body of an insect is said to be *contractile* when the prothorax and head can be folded down on the trunk, as in certain *Coleoptera* and *Hymenoptera*.—**Contractile vacuole.** See *vacuole*.

contractility (kon-trak-til'i-ti), *n.* [= *F. contractilité; as contractile + -ity.*] The inherent property or force by which bodies shrink or contract; more specifically, in *physiol.*, the property which belongs to muscles of contracting under appropriate stimuli. The stimulus normally comes through the nerves, and may be accompanied by volition or not; but it may also be applied artificially, either indirectly through the nerves or directly to the muscle itself, as by electricity, mechanical violence, or chemical action.

It is not pure thought which moves a muscle; neither is it the abstraction *contractility*, but the muscle, which moves a limb.

G. H. Lewes, Probs. of Life and Mind, I. ii. § 3.

The central cord, to whose *contractility* this action is due, has been described as muscular.

W. B. Carpenter, Micros., § 439.

Jer. Taylor, Works (ed. 1835), I. 265.

contraction (kon-trak'shon), *n.* [= *F. contraction = Sp. contraccion = Pg. contracção = It. contrazione, < L. contractio(n)-, contraction, < contrahere, pp. contractus, draw together: see contract, v.*] 1. The act of drawing together or shrinking; the condition of becoming smaller in extent or dimensions through the nearer approach to one another of the parts; the state of being contracted; a decrease in volume, bulk, or dimensions, as from loss of heat. All bodies, with very few exceptions, expand by the application of heat, and contract when heat is withdrawn. (See *expansion* and *heat*.) Contraction also takes place when a gas is condensed to a liquid, and in most cases when a liquid is changed to a solid; there are, however, some exceptions, as water, which expands on solidifying.

Contraction of the pupil takes place not only under the stimulus of light, but also in looking at very near objects. The reason of this is, that correction of spherical aberration is thus made more perfect.

Le Conte, Sight, p. 40.

2. The act of making short, of abridging, or of reducing within a narrower compass by any means; the act of lessening or making smaller in amount; the state of being so lessened; reduction; diminution; abridgment: as, a *contraction* of the currency.

The Nation, July 15, 1875.

Specifically—3. A shortening of a word in pronunciation or in writing: as, can't is a *contraction* of cannot. In writing, contraction takes place, as in pronunciation, primarily by the omission of intermediate letters; but also by writing in a smaller character the last letter above the word contracted, by running two or more letters into one character, by using symbols representing syllables or words, and by the use of initial letters: as, *read*, for *received*; *q'm* for *quam*; & for *et*. Specifically, in *Gr. gram.*, the union of the concurrent vowels of two syllables into one long vowel or diphthong—that is, of *oo* into *o*, of *ee* into *e*, etc. See *abbreviation*, 2.

4. In *anc. pros.*, the use of a single long time or syllable in place of two short times. Thus, in the dactylic hexameter, a spondee (—) can be substituted in the first four feet for a dactyl (— ∪ ∪), one long being metrically equivalent to two shorts; but such a substitution is admissible only in certain kinds of verse and in certain parts of a foot or line, according to special rules. In the dactylic hexameter, for example, the fifth foot must ordinarily be a dactyl, not a spondee. The converse of *contraction* is *resolution*.

5. The act of making a contract; the state of being under a contract, especially one of marriage.

Such an act . . . makes marriage vows As false as diceors' oaths: O, such a deed As from the body of *contraction* plucks The very soul. *Shak., Hamlet, III. 4.*

In *math.*, any device for abridging the mechanical labor of making calculations by diminishing the number of characters written down.—8. The act or process of contracting or acquiring: as, the *contraction* of a debt.—**Dupuytren's contraction** (named after *Dupuytren*, a French surgeon, 1777-1835), in *pathol.*, the fixed flexion of one finger or more, due to the contraction of the palmar fascia. It usually affects the little finger first, is more frequent in males than in females, and seems to be favored by the gouty diathesis.—**Hour-glass contraction**, an irregular, local, transverse contraction of the uterus, at the internal os or above, occurring after the delivery of the child, and delaying the delivery of the placenta.—**Syn.** 3. *Abbreviation, Contraction.* See *abbreviation*.

contractional (kon-trak'shon-al), *a.* [*< contraction + -al.*] 1. Of, relating to, or of the nature of contraction.

One who contracts; one of the parties to a contract, bargain, or agreement; one who covenants with another to do or to refrain from doing a particular thing.

All matches . . . are dangerous and inconvenient where the contractors are not equals. *Sir R. L. Estrange.*

Specifically—2. One who contracts or covenants, either with a government or other public body or with private parties, to furnish supplies, or to construct works or erect buildings, or to perform any work or service, at a certain price or rate: as, a paving-*contractor*; a labor-*contractor*.—3. A muscle which contracts or lessens the size of a part; a constrictor.—**Contractor tracheæ.** in *ornith.*, the contractor of the windpipe, a muscle lying along the trachea, whose action shortens the windpipe by drawing the tracheal rings closer together, and also draws the whole structure backward by being attached to the clavicle or sternum. See *sternotrachealis*.—**Independent contractor.** as distinguished from *servant* or *employee*, a person following a regular independent employment, who offers his services to the public to accept orders and execute commissions for all who may employ him in a certain line of duty, using his own means for the purpose, and being accountable only for final performance. *Cooley, Torts (ed. 1878), p. 549.*

Pope, Moral Essays, ii. 270.

Contradiction in terms, a self-contradictory phrase, as "a square circle."—**Principle of contradiction**, the principle that nothing can be both true and false in the same sense and in the same respects. Modern formal logic demonstrates that this principle enters into a large part of our reasoning, but forms the hinge only of a few very simple inferences (not of direct syllogism). Formerly many logicians regarded the law of contradiction as the governing principle of all demonstrative reasoning. Accordingly, it is often referred to as such without regard to its exact signification. The law was enunciated by Aristotle, but its name was perhaps first given to it by Zamus.

The proposition that no subject can have a predicate which contradicts it is called the *principle of contradiction*. It is a general though negative criterion of all truth.

Kant, Critique of Pure Reason, tr. by Müller, p. 157.

The highest of all logical laws, in other words the supreme law of thought, is what is called the *principle of contradiction*, or, more correctly, the principle of non-contradiction. It is this: A thing cannot be and not be at the same time.

A part answering or corresponding to another, but differing from it in nature and required to make it complete; a complement; a counterpart: as, the hollows in a mold in which a medal has been cast are the converse of the parts of the medal in relief. [*Converse* is often used incorrectly in the sense of *reverse*—that is, the opposite, the contrary.

(*b*) One of a pair of propositions having the same subject and predicate or antecedent and consequent, but in the reversed order. Thus, the proposition that every isosceles triangle has two of its angles equal is the converse of the proposition that every triangle having two angles equal is isosceles. See *conversion*, 2.

The given proposition is called the converted or converse; the other, into which it is converted, the converting. There is, however, much ambiguity, to say the least of it, in the terms commonly employed by logicians to designate the two propositions—that given, and the product of the logical elaboration.

conversion (kɒn-vər'shən), *n.* [= *F. conversion* = *Pr. conversiō* = *Sp. conversiō* = *Pg. conversiō* = *It. conversiōne*, *< L. conversiō(n-)*, *< convertere*, pp. *conversus*, convert: see *convert*, *v.*] 1. In general, a turning or changing from one state or form to another; transmutation; transformation: sometimes implying total loss of identity: as, a conversion of water into ice, or of food into chyle or blood; the conversion of a thing from its original purpose to another; the conversion of land into money.

The conversion of arable land into pasture, which was the chief agrarian grievance, was much more universal among Catholics than among Protestants.

Specifically—2. In *logic*, that immediate inference which transforms a proposition into another whose subject-term is the predicate-term, and whose predicate-term the subject-term of the former. *Simple, proper, or direct conversion* is that in which the quantity and quality of the propositions remain unchanged: as, No good man is unhappy; hence (by conversion), No unhappy man is good. *Conversion per accidens* (by accident) is that in which the quality of the first proposition is unchanged while its quantity is changed: as, All cockatrices are non-existent; hence (by conversion), Some non-existent things are cockatrices. *Conversion by contraposition* is where the quantity and quality are preserved, but the terms are infinitized: as, Some Chinamen are not non-honest; hence, Some non-honest persons are not non-Chinamen. The traditional rules of conversion are embodied in the verses,

Simpliciter feci, convertitur eua per acci,
Astro per contra, sicut conversio tota,

where the vowels of *fecit*, *eua*, *astro*, show the kinds of propositions which can be converted in the three ways. (See *At*, § 20.) A *diminutive conversion* is a conversion of a proposition such that the consequent asserts less than the antecedent: as, All lawyers are honest, and therefore some honest men are lawyers. An *improper or reductive conversion* is a conversion per accidens or by contraposition. A *universal conversion* is an inference by conversion whose conclusion is a universal proposition; a *partial conversion*, one whose conclusion is a particular proposition. [The Latin *conversio* was first used in this sense by Appuleius to translate Aristotle's ἀντιστροφή.]

3. In *theol.*, a radical and complete change, sudden or gradual, in the spirit, purpose, and direction of the life, from one of self-seeking and enmity toward God to one of love toward God and man.

Conversion of St. Paul, a festival of the Roman Catholic and of the Anglican Church, observed on the 25th of January, in commemoration of the conversion of St. Paul the Apostle, as related in the ninth chapter of Acts.—**Syn.** 3. *Conversion, Regeneration.* Conversion is generally employed to express the voluntary act of the individual in turning from sin to seek the pardon and grace of God, while regeneration is employed to express the divine act exerted by the Spirit of God on the soul of man. But this distinction is by no means always observed even in theological writings, and the two terms are often used synonymously.

3. In monasteries, a lay friar or brother admitted to the service of the house, without orders, and not allowed to sing in the choir.—**Clinical convert**. See *clinical*.—**Syn. 1.** *Neophyte*, *Convert*, *Proselyte*, *Pervert*, *Apostate*, *Renegade*. A neophyte is a convert who is still very new to the doctrine or duties of his religion; hence, figuratively, the word stands for a novice in any line; it does not at all suggest the abandonment of any other faith for the present one. A *convert* may or may not be from some other faith; the word expresses a radical change in convictions, feelings, purposes, and actions, and therefore suggests the sincerity of the subject; it is rarely used with a sinister meaning, but it may mean only acquiescence in a new faith proposed for nominal adherence: as, they were offered the choice of death or becoming *converts* to the faith of the conqueror. A *proselyte* is generally from some other faith or alliance, primarily in religion, but also in partisanship of any kind: *proselytism* does not necessarily imply conviction; the tendency is to use only *convert* in the good sense, and apply *proselyte* to one brought over by unworthy motives, and *proselytizer* to one who seeks recruits for his faith without being particular as to their being converted to it. *Pervert* as a noun is new, and confined chiefly to England; it is a paronomasia for *convert*, and a controversial word, stigmatizing one who abandons the Church of England, or one of the other Protestant churches, for the Roman Catholic Church. *Apostate* is a strong term for utter, conspicuous, and presumably base renouncer of the Christian religion, or of any denominational, political, or other faith and affiliation. A *renegade* is one who, presumably without conversion of mind or heart, and from sheer interest, goes over from one faith or party to another; hence, a mere runaway or deserter. The term covers as much abhorrence and reprobation as *apostate*, and more contempt.

St. Paul makes a difference between those he calls *neophytes*—that is, newly grafted into Christianity—and those that are brought up in the faith.

Bacon, Speech on the Union of Laws.

3. [*cap.*] An assembly of the clergy of the Church of England for the settlement of certain ecclesiastical affairs. There are two *Convocations*, viz., of the provinces of Canterbury and York, summoned by writ from the crown to the archbishops. Each body contains an upper house of bishops with the archbishop as president, and a lower house, composed of deans, archdeacons, and elected proctors. Constitutions for both *Convocations* were established in the thirteenth century; later an unsuccessful attempt was made to incorporate them with Parliament. In 1533, by the Act of Submission, their legislative powers were restricted, and their acts have since been dependent upon special warrant from the crown. The *Convocation* of Canterbury was the more important and regular; but after its prorogation in 1717, although its meetings were continued for a time, it received no new royal warrant till 1861. The *Convocation* of York has generally been less regular in its proceedings than that of Canterbury. Both *Convocations* now meet at each parliamentary session, and the proctors are renewed at each parliamentary election.

In England, the Ecclesiastical body called the *Convocation*, which grew up in the reign of King Edward I., gradually attained the position which had been formerly occupied, and executed some of the functions which had formerly been discharged, by Provincial Synods, consisting of Bishops. Bp. Chr. Wordsworth, *Church of Ireland*, p. 204.

The *convocations* of the two provinces, as the recognised constitutional assemblies of the English clergy, have undergone, except in the removal of the monastic members at the dissolution, no change of organisation from the reign of Edward I. down to the present day.

E. A. Freeman, Amer. Lects., p. 369.

2. In math., using or pertaining to systems of coördinates.—Coördinate geometry, the method of treating geometry by means of systems of coördinates; analytical geometry.

II. *n.* 1. Something of the same order, degree, or rank with another or others.

The idea of coördinates excludes that of superior and subordinate, and, necessarily, implies that of equality.

Cathoun, Works, I. 242.

2. In math., a magnitude belonging to a system of magnitudes serving to define the positions of points, lines, planes, or other spatial elements, by reference to a fixed figure; hence, also, a magnitude of a system serving to define the elements of a continuum, in general, as geometrical coördinates do positions in space: thus, the latitude, the longitude, and the height above the mean sea-level are the three coördi-

nates commonly used to define the position of a meteorological station. See *Cartesian*.

Moreover, our various bodily movements and their combinations constitute a network of co-ordinates, qualitatively distinguishable, but geometrically, so to put it, both redundant and incomplete. *J. Ward, Encyc. Brit., XX. 53.*

Areal coördinates, a special variety of trilinear coördinates, consisting of the areas of the three triangles having the variable point for a common vertex, and the other vertices two of the three fundamental points. These areas are taken as affected by such algebraical signs as to sum up to the area of the fundamental triangle.—**Axis of coördinates**. See *axial*.—**Barycentric coördinates**. See *triangular coördinates*, below.—**Biangular coördinates**, the two angles PAB and PBA, where P is a variable point in a plane, while A and B are fixed points. Sometimes the cotangents of these angles are taken as the coördinates.—**Bicircular coördinates**, two quantities serving to define the position of any point in a plane by reference to two series of circles which cut one another under a constant angle. There are two principal kinds of bicircular coördinates. In the first kind, a point having been assumed whose coördinates are to be infinite, two lines are drawn through it (commonly at right angles), and all the coördinate circles have their centers on these lines and pass through their intersection. One circle of each of these series passes through the variable point. If *a* is the distance from the point of infinite coördinates at which either of these circles passes through the line of centers of the circles of the same series, the corresponding coördinate is $A + 1/a$, where *A* is a constant belonging to this coördinate. In the second kind two fixed points, A and B, are assumed. Then, every circle of one series passes through both the points A and B, while each of the second series has its center on the line AB, and cuts all of the first series orthogonally. One coördinate is the angle at A between the line AB and the circle of the first series passing through the variable point, while the second coördinate is $P + Q \log(1/s + 1/S)$, where *s* is the distance from A to the point at which the circle of the second series passing through the variable point cuts the line AB, *S* is the distance AB, and *P* and *Q* are arbitrary constants.—**Bilinear coördinates**. (a) Same as *vectorial coördinates*. See below. (b) Cartesian coördinates, or tangential coördinates based on Cartesian coördinates.—**Binary coördinates**, non-homogeneous coördinates of points or lines in a plane.—**Bipunctual coördinates**, coördinates fixing the positions of points or lines in a plane by reference to two fixed points and a fixed direction of measurement. Bipunctual coördinates are of two kinds, line coördinates and point coördinates. Bipunctual line coördinates are the distances of a variable line from two fixed points measured in a constant direction. Bipunctual point coördinates are, each, the negative of the reciprocal of the distance measured in a fixed direction (the same for both coördinates) from one of two fixed points of the line joining the variable point to the other fixed point. In the figure, S and T being the two fixed points, SM and TN are the coördinates of the line MN; and the negatives of their reciprocals are the coördinates of the point P, the intersection of MT and SN.—**Boothian coördinates** (named after their inventor, the English mathematician James Booth), rectangular tangential coördinates. See *tangential coördinates*, below.—**Cartesian coördinates**. See *Cartesian*.—**Curve coördinates**, coördinates defining curves.—**Curvilinear coördinates**, quantities used to define the positions of points on a given curved surface.—**Elliptic coördinates**, a system of coördinates for defining curves upon an ellipsoid by means of the intersections of two systems of conic hyperboloids.—**Generalized coördinates**, in *analytical mechanics*, the position of quantities serving to define the position of the particles of a system, and treated in a general manner without specifying what they are.—**Homogeneous coördinates**, a system containing one coördinate more than is sufficient for defining the spatial element. One fixed non-homogeneous equation subsists between the coördinates, and every other equation between them is taken as homogeneous.—**Ignorance of coördinates**, the leaving out of account of some of the coördinates of a complicated mechanical system: an omission which is permissible under certain circumstances. Thus, in the kinetical theory of gases the coördinates of the individual molecules are not considered.—**Isothermal coördinates**, any pair of quantities serving to define the positions of points in a plane by means of two series of curves cutting one another at right angles.—**Line coördinates**, a homogeneous system of six coördinates fixing the position of a variable line in space.—**Oblique system of coördinates**, in *analytical geom.*, a system in which the coördinate axes are oblique to each other.—**Origin of coördinates**, a point whose coördinates are equal to zero; the intersection of the axes of coördinates.—**Orthotomic coördinates**, a system of three quantities determining the positions of points in space by reference to three series of surfaces cutting one another orthogonally.—**Point or punctual coördinates**, such coördinates as determine the positions of points.—**Polar coördinates in a plane**, a system of coördinates consisting of a radius vector, or the length of a line from the variable point to be defined to a fixed point termed the *origin*, and a vectorial angle, or angle between the radius vector and a fixed line through the origin, called the *initial line*, or polar axis.—**Polar coördinates in space**, a system of coördinates consisting of a radius vector, a plane vectorial angle, and a dihedral angle. A radius vector and three direction-cosines used to determine the position of points in space are also sometimes called *polar coördinates*.—**Quadrilinear coördinates**, homogeneous point coördinates in space defining a variable point by its distances from four fixed planes, these distances being measured in fixed directions.—**Rectangular coördinates**, a system of quantities serving to determine positions by a reference

to two axes in a plane, or three in space, which cut one another at right angles.—**Rodrigues's coördinates**, a certain system of quantities serving to define the position of a rigid body which has one point fixed. Such a body can be brought from any assumed position to any possible position by means of a rotation round an axis through the fixed point. Three of Rodrigues's coördinates are the direction-cosines of this axis, and the fourth is the angle of rotation.—**Spherical coördinates**, quantities analogous to latitude and longitude, used to determine the positions of points on a given sphere.—**Tangential coördinates**, coördinates defining the positions of lines in a plane or of planes in space.—**Tetrahedral coördinates**, or *barycentric coördinates in space*, quadriplanar coördinates whose fixed equation is

$$x + y + z + w = T,$$

x, y, z, w being the coördinates.—**Triangular or barycentric coördinates**, trilinear coördinates the fixed equation of which is

$$x + y + z = T,$$

where *x, y, z* are the coördinates.—**Trilinear coördinates**, a system of homogeneous coördinates defining the positions of points in a plane in which the fixed figure of reference is a triangle, called the fundamental triangle or triangle of reference, and the coördinates are the distances of the variable point from the sides of this triangle measured in three fixed directions.—**Vectorial coördinates**, the distances of a variable point in a plane from two fixed points. Also *bilinear coördinates*.

Some of the softer kinds are also called *anime*. Copal may be dissolved by digestion in linseed-oil, with a heat a little less than sufficient to boil or decompose the oil. This solution mixed with spirit of turpentine forms a beautiful transparent varnish, which, when properly applied and slowly dried, is exceedingly durable and hard. There are various methods of preparing it. The most highly prized copal is that obtained from Zanzibar and Mozambique, the product of leguminous trees, *Trachilobium Hornemannianum* and *T. Mozambicense*, and often dug from the ground in a semi-fossil state. Several varieties are obtained from the western coast of Africa, all probably furnished by species of *Copaifera*. Manila or Indian copal is obtained from *Vateria Indica*. Kauri copal, from New Zealand and New Caledonia, is found in the soil in large masses, the product of species of *Agathis* (*Dammara*). South American copals are obtained from *Hymenaea Courbaril* and other allied leguminous trees, as well as from some burseraceous species. (See *anime*.) Cf. *coparcener*.] Partnership in inheritance; joint heirship; joint right of succession, or joint succession, to an estate of inheritance in lands. It is usually semicircular in shape, and is fastened in front at the height of the shoulders by a clasp called a *morse*. Originally it had a hood, and the piece of embroidery descending from the back of the neck is still called the *hood*. The cope is one of the vestments which vary in color with the festival or season. The straight edge is usually ornamented with a broad orphrey or border of embroidery.

As distinguished from the chasuble, the cope is a processional or choral vestment, while the chasuble is sacrificial or eucharistic. In the Church of England the cope was sometimes used instead of the chasuble, and at the time of the Reformation the chasuble itself was often called a cope. The 24th canon of 1603 (still in force) orders the cope to be worn by the celebrant in all cathedral and collegiate churches. It continued to be worn at the altar and at other times till the middle of the eighteenth century, especially in cathedrals, but had fallen gradually more and more into disuse till revived in recent times. A decision of the judicial committee of the Privy Council in 1871 limited its use to that enjoined in the canon of 1603. In England in the middle ages a long open black mantle sewn together in front over the neck and chest was worn by canons, and called the *canon's cope*. See *mandyas* and *pluvial*.

They [the clergymen] walked partly in *coapes* . . . and partly in surplices. *Coryat*, Crudities, I. 37.

The Gr. name was *χαλκός*: see *chalchitis*, etc.] 1. n. 1. Chemical symbol, Cu; atomic weight, 63.3. A metal distinguished from all others by its peculiar red color. Its crystalline form is that of the cube or regular octahedron (isometric). Its specific gravity is nearly nine times that of water (8.938 native copper, 8.958 electrolytic copper). Among the metals in common use, it stands next to gold and silver in malleability and ductility, and next to iron and steel in tenacity. Its melting-point is a little below that of gold and considerably above that of silver. Copper is one of the most widely diffused metals, and occurs in the native state, as well as in a great variety of sulphureted and oxidized combinations. Native copper is not unfrequently met with in the superficial portions of cupriferous lodes, but usually only in small amount. In two regions, however, this metal is mined exclusively in the native state, namely, the south shore of Lake Superior, and Corocoro in Bolivia; but of the two the former is by far the more important, and produces about one sixth of the total yield of the world. In the Lake Superior region the copper occurs in regular fissure-veins, and also in a conglomerate of volcanic origin, forming the cement by which the pebbles are held together. In the fissure-veins large masses of native copper have frequently been found, one such mass weighing over three hundred tons. Most of the copper of the world, previous to the opening of this region, was produced from ores consisting of combinations of the metal with certain mineralizers, such as sulphur and oxygen, and especially sulphur. The most abundant ore is the so-called "yellow copper ore" or copper pyrites, the chalcopryite of the mineralogist, which is composed of copper, iron, and sulphur, and contains, when chemically pure, 34.6 per cent. of copper. The total copper-production of the world for the year 1886 may be estimated at 215,000 tons, of which the United States produced about one third; it had increased rapidly within the preceding twenty-five years. The copper of the United States comes chiefly from Lake Superior, Arizona, and Montana. Spain, Chili, Prussia, and Australia are other large producers of this metal. Copper has been known from the remotest ages, and was mined extensively on Lake Superior before the advent of Europeans. Its uses are manifold. The most important of them was, before the very general use of iron in ship-building, as a sheathing metal, first by itself, and later as a part of the alloy called *yellow metal*, a variety of brass. On account of its electric conductivity, copper is largely used for induction-coils and all kinds of electrical apparatus, and for the cores of telegraph-cables. For these uses very pure copper is required; a slight admixture of iron greatly increases its electrical resistance. For domestic purposes copper is made up in a great variety of forms, either by itself, or tinned in order to prevent corrosion by acid liquids. The electrolytic process depends on the deposition by the galvanic current of pure copper from a solution of one of its salts, the metal deposited forming an exact reproduction in copper of an object suspended for that purpose in the bath. The alloys of copper are of great importance, and one of them, bronze, is of high antiquity. The salts of copper are also numerous, and are invaluable in the arts. Copper sulphate, or blue vitriol, is largely used in calico-printing, in electro-metalurgy, and in the preparation of the copper pigments Scheele's green, Schweinfurt green, and Paris green, the latter being much used as an insecticide, principally for the Colorado potato-beetle. See *brass*, *bronze*, and *yellow metal* (under *metal*).

2. A vessel made of copper, particularly a large boiler; specifically, in the plural, the large kettles or boilers in a ship's galley for boiling food for the ship's company. In England, a tenure of lands of a manor, according to the custom of the manor, and by copy of court-roll; or a tenure for which the tenant has nothing to show except the rolls made by the steward of the lord's court, which contain entries of the admission of the original or former tenant, his surrender to the use of another, or alienation, or his death, and the claim and admission of the heir or devisee. There are two sorts of copyhold: the first is styled *ancient demesne*, or a customary freehold; and the second a *base tenure*, or mere copyhold. Copyhold property cannot be now created, for the foundation on which it rests is that the property has been possessed time out of mind by copy of court-roll, and that the tenements are with the manor. Copyholds now descend to the heir at law, according to the rules that regulate the descent of all other kinds of estate in land.

Same as *II.*—**Coracoid fontanelle**, a space or vacuity between or among several coracoid elements, as in batrachians.—**Coracoid process**, the coracoid of a mammal above a monotreme.

II. n. The distal or ventral element of the scapular arch, extending from the scapula to or toward the sternum, of whatever size, shape, or position: so named from the fact that in adult man it somewhat resembles the beak of a crow in size and shape. See cut under *scapula*. In reptiles, birds, and monotrematous mammals the coracoid is a comparatively large, distinct, and independent bone, articulated at one end with the shoulder-blade and at the other with the sternum. (See cuts under *hypocleidum* and *pectoral*.) In all mammals above the monotremes it is much reduced, becoming a mere process of the scapula, firmly ankylized therewith and having no connection with the sternum, but normally having an independent center of ossification. In amphibians the coracoid varies in condition and relations, but when present conforms to the above definition. In batrachians the coracoid is divided by a large membranous space or fontanel into a coracoid proper, which lies behind this space, a persistently cartilaginous epicoracoid, which bounds the space internally, and a precoracoid in front of it. In fishes the term *coracoid* has been applied to several different parts, on the assumption of their homology with the coracoid of the higher vertebrates (see cut under *scapulocoracoid*): (a) by Cuvier and his followers, to the teleostemoral; (b) by Owen and others, to the prescapula; (c) by Parker and other late writers, to the hypocoracoid; (d) by Gill, to the inner cartilage of the scapular arch and the bones into which it is disintegrated in the higher fishes. See these names, and also *ectocoracoid*, *epicoracoid*, *hypercoracoid*, *precoracoid*, *procoracoid*.

It is an immense assemblage, containing a majority of all birds. They exhibit the typical passerine structure, or the "crow form." Their technical characters are: an egithognathous palate; no basipterygoid processes; a forked manubrium sterni; the sternum single-notched behind and with short costiferous extent (with few exceptions); usually a hypocleidium; an accessory scapulohumeral bone; a mobile insistent hallux directed backward; a normal ratio of digital phalanges (2, 3, 4, 5); one caroid, the left; a syrinx presenting every degree of complexity; a nude oil-gland; and aftershafted plumage. It is normally less than 90°, as in nearly all birds, but in the ratite birds approaches 180°, thus affording one of the strong diagnostic marks of *Ratitae* as compared with *Carnitae*.—**Coracoscapular foramen**. See *foramen*.

A general term for the hard calcareous skeleton secreted by the marine coelenterate polyps for their support and habitation (polypidom). The coral-pro-

ducing zoöphytes are usually compound animals, young buds sprouting from the body of the parent polyp and remaining connected with it on the same spot even after it is dead; so that a piece of coral may be regarded as the abode either of one compound animal or of a multitude of individuals. The coralline structure sometimes branches like a shrub, sometimes spreads like a fan, or assumes the appearance of a brain, a flower, a mushroom, etc. (See cut under *brain-coral*.) These structures sometimes, as in the Pacific and southern parts of the Indian ocean, form reefs from 20 yards to several miles in breadth, extending for hundreds of miles along the coasts, and also the peculiar coral islands known as *atolls*. There is a hard homogeneous sclerobasic axis, on which the value of the coral depends. There are eight pinnately fringed tentacles and other characters separating the family so widely from most corals that it does not belong to the same order, but to the alcyonarian or octocoralline division of the *Coralligena*, many of which are not coralligenous; and its affinities are with the gorgoniaceous polyps, as the sea-fans, etc. See *Corallium*, *Coralligena*.

corban (kōr'ban), *n.* [Heb. *korbān*, an offering, sacrifice, < *karab*, approach, bring, offer. Cf. *corbana*.] 1. In *Judaism*, an offering of any sort to God, particularly in fulfillment of a vow. To the rules laid down in Lev. xxvii. and Num. xxx. concerning vows, the rabbins added the rule that a man might interdict himself by vow not only from using for himself any particular object, for example food, but also from giving or receiving it. The thing thus interdicted was considered as corban. A person might thus release himself from any inconvenient obligation under plea of corban—a practice which Christ reprehended, as annulling the spirit of the law.

But ye say, If a man shall say to his father or mother, It is *Corban*, that is to say, a gift, by whatsoever thou mightest be pruned by me; he shall be free. Mark vii. 11.

Origen's account of the *corban* system is that children sometimes refused assistance to parents on the ground that they had already contributed to the poor fund, from which they alleged their parents might be relieved.

In France, before the adoption of the metric system, it was likewise called a *corde*; there were three kinds, containing respectively 64, 56, and 112 French cubic feet. In Germany the similar measure is called a *Klafter*; in Gotha and Brunswick it is 6 by 6 by 3 local feet.

It had cheek-pieces continuous with the back, extending beneath the chin, and separated in front by a narrow opening in part closed by a nasal and extending to the eye-holes. The usual form of abacus is concave on each of its sides, the projecting angles being supported by graceful shoots of acanthus, forming volutes which spring from *caules* or stalks originating among the foliage covering the lower part of the capital. These *caules* also give rise to lesser stalks or *cauliculi*, and to the spirals called *helices*, turned toward the middle, and supporting an anthemion or other ornament in the middle of each side of the abacus. In the best Greek examples the shaft is fluted like the Ionic, and the base called *Attic* is usual. The entablature also resembles the Ionic. The Corinthian order is of very

early origin, though it did not come into favor among the Greeks until comparatively late. The legend of the evolution of the Corinthian capital by Callimachus, in the fifth century B. C., from a calathus (woman's basket) placed on a maiden's tomb and covered with a tile, about which the leaves of a plant of acanthus had grown, is a fable. Among notable Greek examples of the order are the Tholos of Polycytus at Epidaurus (fifth century B. C.), the choragic monument of Ixikrates at Athens (335–4 B. C.), and the temple of the Olympian Zeus at Athens, finished by Hadrian. The rich character of the order commended it to the Romans, who, as well as their followers of the Renaissance, used it freely, and modified it in accordance with their taste.—**Corinthian pottery**, *Corinthian ware*. See *Corinthian style*.

A large totipalmate swimming and diving bird of the family *Phalacrocoracidae* (which see for technical characters). There are about 25 species, of all parts of the world, much resembling one another, and all usually comprised in the single genus *Phalacrocorax*. They are mostly maritime, but some inhabit fresh waters; they are gregarious, and in the breeding season some species congregate by thousands to breed on rocky ledges over the sea, or in swamps, build-

ing a rude bulky nest, and laying from 1 to 3 whole-colored greenish eggs coated with a white chalky substance. Their principal food is fish, and their voracity is proverbial. The common cormorant of America, Europe, and Asia, *Phalacrocorax carbo*, which may be taken as the type of the whole, is about 3 feet long and 5 in extent, with a heavy body, long sinuous neck, a stout hooked bill about as long as the head, a naked gular pouch, stout strong wings, and 14 stiff tail-feathers denuded to the bases. The color is lustrous black, bronzed on the back, where the feathers have black edges; the feet are black; in the breeding season there is a white flank-patch; and on the head are scattered white thready plumes. The same or a similar species is domesticated by the Chinese and Japanese and taught to fish. A smaller species, the crested cormorant, *P. cristatus*, is found in Europe, and is known as the *shag*, a name also used for cormorants at large. The commonest North American species is the double-crested cormorant, *P. dilophus*, having only 12 tail-feathers (the number usual in the genus), the gular sac convex behind, and a crest on each side of the head. The Florida cormorant, which breeds by thousands in the mangrove swamps, is a variety of the last. On the Pacific coast of the United States several other species occur, as the violet-green cormorant (*P. violaceus*), the red-faced (*P. brevirostris*), the tufted (*P. penicillatus*), and others. The Mexican cormorant, *P. mexicanus*, is a small species which extends into the United States. A few species are largely white, and others are spotted.

At different periods in the history of Europe coronation has been essential to entrance upon kingly dignity and power; but where the order of succession is perfectly established, the authority of the new sovereign is considered as beginning with the death of his predecessor, and the coronation is only a ceremonial consecration.

In Greece garlands of olive-branches, twined with white and purple ribbon, are used for this purpose; in Russia, metal crowns belonging to the church, and preferably of gold or silver. This ceremony is mentioned by St. Chrysostom and other early Christian writers.

The term *correlation*, which I selected as the title of my Lectures in 1843, strictly interpreted, means a necessary mutual or reciprocal dependence of two ideas, inseparable even in mental conception; thus, the idea of height cannot exist without involving the idea of its correlate, depth; the idea of parent cannot exist without involving the idea of offspring.

3. In *physiol.*, specifically, the interdependence of organs or functions; the reciprocal relations of organs.

Some instances of *correlation* are quite whimsical: thus, cats which are entirely white and have blue eyes are generally deaf.

Thus, the following propositions are correlative: any two lines which intersect in a point lie in one plane; any two lines which lie in one plane intersect in a point.—**Correlative terms**, a pair of terms implying a relation between the objects they denote, as *parent* and *child*.

II. *n.* Either of two terms or things which are reciprocally related; a correlate. Careful writers distinguish the terms as *correlatives*, the things as *correlates*. In the medieval Latin, which has greatly influenced English terminology, this distinction is constantly maintained.

The white fibrous substance clothing the seeds of the cotton-plant (*Gossypium*). See cut under *cotton-plant*. It consists of simple delicate tubular hair-like cells, flattened and somewhat twisted. Its commercial value depends upon the length and tenacity of the fiber. It is the clothing material of a large proportion of the human race, its use dating back to a very early period. In commercial importance cotton exceeds all other staples. Great Britain ranks first in the consumption of the raw material, the United States being second, and then France. Cotton consists of nearly pure cellulose, and when acted upon by nitric acid yields a nitro-compound known as gun cotton, which is a powerful explosive, and when dissolved in ether and alcohol forms collodion. Cotton is very extensively used in the manufacture of thread, and for many purposes in the arts. In surgery it is employed for many purposes, and especially as a dressing for burns, scalds, etc. See *cotton-plant*, *Gossypium*.

2. Cloth made of cotton. It was originally obtained in Europe from India, always famous for the excellence and fineness of its cotton fabrics, as in the Dacca muslins, and has long been in use throughout the East. In 1700 the importation into England was prohibited, and in 1721 fines were imposed upon the venders and wearers of cotton, because it was thought to interfere with the home manufacture of woollens and linens. Modern inventions facilitating its manufacture by machinery have built up an immense industry in Europe and the United States. See *cotton-gin*, *spinning-jenny*.

In this the fiber rests upon or against a grid into the openings of which project the teeth of a gang of saws mounted upon a revolving mandrel. The teeth of the saws catch the fibers and draw them away from the seeds. The latter, being too large to pass through the openings, roll downward and out of the machine. The fibers, removed from the saws by a revolving brush, pass between rollers, and are delivered from the machine in the form of a lap. Other and similar machines have projecting needles, or hooked or covered wire teeth, instead of saws. In the *roller-gin* the fibers are drawn between rollers guarded by blades which prevent the passage of the seeds. Another form has an intermittent action, the fibers being held between nipping blades and the seeds pushed clear from them, fiber and seed being delivered in different directions.

*count*² (kount), *n.* [Not in *ME.* except in fem. form *countess*, *q. v.*; < *OF.* *conte*, *comte*, *F.* *comte* = *Pr.* *coms* = *Sp.* *Pg.* *conde* = *It.* *conte*, < *L.* *comes* (*comit-*), a companion, later a title of office or honor (cf. *companion*), < *com-*, together, + *ire*, supine *itum*, go, = *Gr.* *iva*, go: see *go*.] A title of nobility in France, Italy, Spain, and Portugal (corresponding to *earl* in Great Britain and *graf* in Germany), whence the name *county*, originally applied to the domain appertaining to the holder of such a title. Under the Roman republic a count was a companion or an assistant of a praetor or a proprietor in his foreign government; under the empire, an officer of the imperial household, or an attendant upon the emperor in his official duties, the title being ultimately extended to officers of various grades in different parts of the empire. Among early Teutonic races the count or graf was the officer set by a sovereign over a district or gau, charged with the preservation of the king's authority. In France, under Charles the Bald, a system of government by counts as personal agents of the sovereign was developed. Later, with the growth of the feudal system, they became the feudal proprietors of lands and territories, and thus not merely royal officers, but nobles, and, as such, hereditary rulers. At the present time the title, inherited alike by all the sons of a count or conferred by the sovereign, serves merely to indicate nobility. As a title, count does not occur in the nomenclature of the English nobility, except as in count palatine; but the feminine form *countess* is the recognized feminine equivalent of *earl*.

The prince, the count, . . . and all the gallants of the town, are come.

Count palatine. (a) Originally, the judge and highest officer of the German kings, afterward of the German emperors and archdukes; at a later date, an officer delegated by the German emperors to exercise certain imperial privileges. (b) Formerly, in England, the proprietor of a county, who exercised regal prerogatives within his county, in virtue of which he had his own courts of law, appointed judges and law officers, and could pardon murders, treasons, and felonies. All writs and judicial processes proceeded in his name, while the king's writs were of no avail within the palatinate. The Earl of Chester, the Bishop of Durham, and the Duke of Lancaster were the counts palatine of England. The queen is now Duchess and Countess Palatine of Lancaster. The earldom palatinate of Chester, similarly restricted, is vested

in the eldest son of the monarch, or in the monarch himself when there is no Prince of Wales. Durham became a palatine in the time of William the Conqueror, and the dignity continued in connection with the bishopric till 1836, when it was vested in the crown. See *palatine*, and *county palatine*, under *county*.

(b) Less strictly, any imitation of such a thing and for such a purpose, as a genuine farthing clipped to pass for a sovereign, or a coin clipped at the edges and then milled, to give it the appearance of a fresh coin, or a fraudulent imitation of a bank-note. It has been held that a bank-note printed from a genuine plate, but having false signatures affixed in imitation of genuine ones, is more appropriately called a *forgery*; that such a note having fictitious or imaginary names affixed is more appropriately called *spurious*; and that only a note printed from a false plate is appropriately called a *counterfeit note*. But according to the strictest usage, it would be proper to say, in these several cases, respectively, that the milling was *counterfeit*, that the false signatures were *counterfeit*, and that naming the bank falsely with imaginary officers was a *counterfeiting*; and the better opinion is that a statute prohibiting counterfeiting may be deemed violated if any of the features of the genuine thing is counterfeited so as to serve the false purpose.

3. In *music*: (a) The art of musical composition in general. (b) The art of polyphonic or concerted composition, in distinction from homophonic or melodic composition. (c) Specifically, the art of adding to a given melody, subject, theme, or canto fermo, one or more melodies whose relations to the given melody are fixed by rules. Strict or plain counterpoint, which began to be cultivated in the thirteenth century, and attained great extension and perfection in the fifteenth, is usually divided into several species: (1) *note against note*, in which to each note of the cantus is added one note in the accompanying part or parts; (2) *two against one*, in which to each note of the cantus two notes are added; (3) *four against one*, in which four notes are added; (4) *syncopated*, in which to each note of the cantus one note is added after a constant rhythmic interval; (5) *florid or figured*, in which the added part or parts are variously constructed. The melodic and harmonic intervals permitted in each species are minutely fixed by rule. Counterpoint is *two-part* when two voices or parts are used, *three-part* when three are used, etc. It is *single* when the added part uniformly lies above or below the cantus; *double* when the added part is so constructed as to be usable both above and below the cantus by a uniform transposition of an octave, a tenth, or some other interval; and *triple* when three melodies are so fitted as to be mutually usable above and below one another by transposition. Among the forms of counterpoint, the canon and the fugue are the most important. (See these words.) Next to a pure and natural use of melodic intervals, various kinds of imitation between the voices are specially sought, such as augmentation, diminution, inversion, reversion, etc. (See these words.) The practice of counterpoint was specially prominent in the Galilei school of musicians from the thirteenth to the sixteenth century, and it has been a part of musical training and accomplishment ever since. It is a necessary basis for all polyphonic composition, although in modern music the strictness of its early rules has been much relaxed. (a) Originally, the domain or territory of a count or earl. (b) Now, a definite division of a country or state for political or administrative purposes. In the United States the county is the political unit next below the State (except in Louisiana, which has an analogous division into parishes). Each county has, generally speaking, one or more courts, a sheriff, treasurer, clerk, and various officials engaged in the administration of justice, etc. The number of counties varies greatly in the different States. England has 40 counties (the greater number of which are also called *shires*), Wales 12, Scotland 33, and Ireland 32. An English county has a lord lieutenant, a custos rotulorum or keeper of records, a sheriff, and other officials. Certain larger British cities are counties in themselves, or counties corporate. Abbreviated *Co.* or *co.*

The town and the county have shaped the life of the States of the Union. In this respect there are three classes of States; those in which the town is the political unit—the six States of New England; the second, those in which the county is the unit—the States of the South; the third, those of the "compromise system," as it has been called—a mixed organization of county and township, prevailing in the Middle States and the West.

Austin Scott, Johns Hopkins Univ. Studies, III.

2. Collectively, the inhabitants of a county.—**County corporate**, in England and Ireland, a city or town possessing the privilege of being governed by its own sheriffs and other magistrates, irrespective of the county or counties in which it is situated, as Bristol, Newcastle, Dublin, etc.—**County palatine**, in England, formerly, a county distinguished by particular privileges: so called because the owner or holder had royal powers, or the same powers in the administration of justice as the king had in his palace

(see *palatine*); but all such powers are now vested in the crown. The counties palatine in England are Lancaster, Chester, and Durham, which were no doubt made separate regalities on account of their respective proximity to Wales and to that turbulent Northumbrian province which could be accounted a portion neither of England nor of Scotland.

II. *a.* Of or pertaining to a county: as, *county families*; *county society*.—**Board of county commissioners**, an elective board to which, in most counties in the United States, the administration of many important affairs of the county is intrusted. In some States it consists of the supervisors of the townships (or towns) comprised within the county. The duties of the board vary in different localities.—**County clerk**. See *clerk*.—**County court**, a court having jurisdiction for a county, usually over actions for a limited amount, and often having some administrative powers, established to facilitate minor litigation. In early English history the county court was a local parliament, containing, in its full session, the archbishops, bishops, abbots, priors, earls, barons, knights, and freeholders, with representatives from each township and each borough. It sat once a month, but these monthly sessions were attended by none but those who had special business, and by the officers of the townships with their qualified juries. The existing county courts of England were established under a statute of 1846, each comprising a defined circuit, and sitting usually once a month in each of certain divisions called *county-court districts*. They have jurisdiction for the recovery of small debts, and also certain powers in equity and bankruptcy, and sometimes in admiralty. In the United States each county has a county court for local jurisdiction. In some of the States it is formed by associating all the justices of the peace of the county, and is charged with the administration of county police. See *police*.—**County rates**, in Great Britain and Ireland, rates which are levied upon the county, and collected by the boards of guardians, for the purpose of defraying the expenses to which counties are liable, as repairing bridges, jails, houses of correction, etc.—**County sessions**, in England, the general quarterly sessions of the peace for each county, held four times a year.—**County town**, the chief town of a county; a county-seat.

The principal *coup d'état* in French history, distinctively so called, are that of November 9th, 1799 (18th Brumaire, year VIII., in the republican calendar), when Napoleon Bonaparte forcibly suppressed the Directory, and that of December 2d, 1851, when Louis Napoleon as president broke up the National Assembly by force of arms and made himself temporarily dictator, preparatory to becoming emperor as Napoleon III., a year later.

The news of the *coup d'état* took England by surprise. A shock went through the whole country. Never probably was public opinion more unanimous, for the hour at least, than in condemnation of the stroke of policy ventured on by Louis Napoleon, and the savage manner in which it was carried to success. *J. McCarthy, Hist. Own Times*, xxii.

Singularly enough, the taking of a scalp does not *count a coup*, neither does the killing of an enemy. In *pros.*, two lines in immediate succession, usually but not necessarily of the same length, forming a pair, and generally marked as such by rhyming with each other. A pair of lines joined by rime is considered a couplet, whether it forms part of a stanza or constitutes a metrical group by itself. See *distich*.

A sudden couplet rushes on your mind,
Here you may nameless print your idle rhymes. *Crabbe*.

2. In *music*, two equal notes inserted in the midst of triple rhythm to occupy the time of three; a temporary displacement of triple by duple rhythm.—3. One of a pair, as of twins; a twin.

coupling (kup'ling), *n.* [*Verbal n. of couple, v.*] 1. The act of uniting or joining.

3. The act of embracing sexually; copulation.—4. That which couples or connects, as rafters in a building.

Even to the artificers and builders gave they it, to buy hewn stone, and timber for couplings. 2 Chron. xxxiv. 11. Specifically.—(a) In *music*: (1) A couplet. (2) A couple. (b) The general name for a great variety of mechanical appliances for uniting parts of constructions or parts of machines, for the purpose of adding strength, of transmitting motion from one part to another, or of making a continuous passage, as for a liquid, a gas, or an electric current. A buckle, binding-screw, or fish-plate may illustrate the first; a clevis, a bell-coupling, shaft-coupling, or car-coupling, the second; a pipe-coupling or binding-post, the last. In a narrower sense a coupling is: (1) A device for uniting the ends of shafting, or a coupling-box. (See cut under *coupling-box*.) Such couplings are divided into

two simple classes, those that are fixed permanently on the shafting and those that are adjustable, connected or not at will, or working automatically under variations of the power. Those operated by hand, whatever the particular application of the power, are called *shifting couplings*. The automatic couplings depend chiefly on friction, the adjustment being such that under a certain load the power is communicated, while a sudden addition to the load may exceed the friction and throw the coupling out of operation. (2) A device for uniting two railroad-cars in a train. The form at one time used almost exclusively in the United States, and still retained for freight-cars, is a single link or shackle fitting into jaws at the ends of the draw-bar and held in position by pins. This has been superseded on passenger-cars by self-acting couplings, consisting usually of hooked jaws, which slide past each other and are self-locking by means of springs or their own weight. Levers are also used to operate the couplings from the car-platform. Also called *coupler*. (3) The part which unites the front and rear axles, or the axle-boleter, of a carriage; the perch or reach. In some carriages the bottom of the carriage forms the one coupling. (4) The space between the tops of the shoulder-blades and the tops of the hip-joints of a dog.

The term denotes the proportionate length of a dog, which is spoken of as short or long in the *couplings*.

V. Shaw, Book of the Dog.

Ball-and-socket coupling. See *ball*.—**Differential coupling**, an extensible coupling designed for varying the speed of that part of the machinery which is driven. —**Disk coupling**, a kind of permanent coupling which consists of two disks keyed on the connected ends of the two shafts. In one of the disks there are two recesses, into which two corresponding projections on the other disk are received, and thus the two disks become locked together. This kind of coupling wants rigidity, and must be supported by a journal on each side, but it possesses the double advantage of being easily adjusted and disconnected. — **Dynamometer coupling.** See *dynamometer*. — **Flexible coupling**, a device for joining pieces of shafting which are not exactly in line, or of which the relative direction is varied in the course of the work, as in a dental engine. It consists of pairs of jointed arms united by universal joints, or of spiral springs fastened at each end to the two pieces of shafting that are to be united, or of plugs or rods of rubber fitted to the shafting. — **Flexible pipe-coupling**, a pipe-connection consisting of two bell-shaped joints with a short pipe between them, which fits into each bell and enables the two pipes to be laid out of line while yet keeping the joints tight. — **Half-hose coupling**, a coupling which has a sleeve at one end with an internal thread to receive a pipe, while a hose is bound on a corrugated tube-shaped portion at the opposite end. — **Half-lap coupling**, a kind of permanent coupling in which the boss-ends of the connected shafts are made semi-cylindrical, so that they overlap each other. The coupling-box is a plain cylinder bored to fit, and is kept in its place by a parallel key or feather, as shown in the annexed figure. — **Right-and-left coupling**, a turn-buckle. — **Sleeve coupling**, a tube within which the abutting ends of shafting are coupled together. — **Slip-clutch coupling**, a form of coupling belonging to the class of friction-couplings. It is represented in its best form in the annexed figure. On the shaft B is fixed a pulley, which is embraced by a friction-band *a* as tightly as may be required. This band is provided with projecting ears, with which the prongs *b b* of a fixed cross *c* on the driving-shaft *A* can be shifted into contact. This cross is free to slide endwise on its shaft, but is connected to it by a sunk feather, so that being thrown forward into gear with the ears of the friction-band, the shaft being in motion, the band slips round on its pulley until the friction becomes equal to the resistance, and the pulley gradually attains the same motion as the clutch. The arms and sockets *c c*, which are keyed fast to the shaft *A*, are intended to spring and support the prongs and to remove the strain from the shifting part. — **Square coupling**, in *mill-work*, a kind of permanent coupling of which the coupling-box is made in halves and square, corresponding to the form of the two connected ends of the shafts. The two halves of the box are bolted together on the opposite sides, as represented in the annexed figure. — **Thimble coupling**, a kind of permanent coupling in which the coupling-box consists of a plain ring of metal, supposed to resemble a tailor's thimble, bored to fit the two connected ends of the shafts. The connection is secured either by pins passed through the ends of the shafts and the thimble, or by a parallel key or

feather bedded in the boss-ends of the shafts, and let into a corresponding groove cut in the thimble. This last is now the more common mode of fitting. This kind of coupling is also known under the names of *ring coupling* and *jump-coupling*.

Specifically.—(a) An interest certificate printed at the bottom of a bond running for a term of years. There are as many of these certificates as there are payments to be made. At each time of payment one is cut off and presented for payment. In the United States coupons are negotiable instruments on which suits may be brought though detached from the bond. A purchaser of an over-due coupon takes only the title of the seller. Negotiable coupons are entitled to days of grace. (b) One of a series of conjoined tickets which bind the issuer to make certain payments, perform some service (as transportation over connecting railroad lines), or give value for certain amounts at different periods, in consideration of money received. At the settlement of each claim a coupon is detached and given up.

See *Virginia coupon cases*, under *casel*.—**Coupon ticket**, a ticket of admission to a place of amusement, entitling the holder to a specified seat, and printed in two parts, of which one is torn off and returned to the holder on entering.—*Virginia coupon cases*. In Connecticut and Georgia the highest court of original jurisdiction is termed the Superior Court. In Kentucky the name is given to an intermediate court of appeal.—**Supreme Court**, the designation usually prescribed by law for the highest court of the state or nation which has any original jurisdiction of a general nature. In the United States the name is usually given to the court having a general appellate jurisdiction over inferior courts, and original jurisdiction to supervise the proceedings of inferior courts and of public officers, by the special writs of mandamus, certiorari, prohibition, habeas corpus, quo warranto, and the like. The term has no fixed general meaning apart from the statute conferring it. For instance, in many States the jurisdiction of the Supreme Court is purely appellate and supervisory. In England the Supreme Court includes the various divisions, Chancery, Queen's Bench, etc. (formerly called the Superior Courts, which have original and appellate jurisdiction), and the Court of Appeal (which has no original jurisdiction, but reviews the proceedings of the various divisions); and the decisions of the Court of Appeal are in turn reviewed by appeal to the House of Lords. In New York the name is given to the court having general original jurisdiction at law and in equity throughout the State, of all classes of actions, civil and criminal, except such minor, local, and peculiar matters as for reasons of convenience are confined in the first instance to inferior courts; and its final judgments are for the most part subject to review in the Court of Appeals. But it has also appellate jurisdiction over many inferior courts. In New Jersey the Supreme Court has both original and appellate jurisdiction at law, while the equity jurisdiction is vested in the Court of Chancery, and both are subject to review in the Court of Errors and Appeals. In Connecticut the court of general original jurisdiction in law and equity is termed the Superior Court, and the appellate court is termed the Supreme Court of Errors. In Kentucky the term Superior Court is given to an appellate court, whose decisions are in turn reviewed by a Court of Appeals. The Supreme Court of the United States has original jurisdiction in cases affecting ambassadors and other public ministers and consuls, and those in which a State is a party. Its principal business is in the exercise of its appellate jurisdiction, which includes (subject to complex restrictions in many cases of cases) civil cases in the courts established by act of Congress; federal questions determined in State courts of last resort adversely to a claim of federal right; and a supervisory jurisdiction over criminal proceedings in United States circuit courts when two judges are disagreed.—**Surrogate's court**, in some of the United States, a probate court.—**The courts of the Lord**, the temple at Jerusalem; hence, a church or public place of worship.

The custom was observed, according to Diodorus, among the Corsicans; and Strabo notices it among the Spanish Basques, by whom, as well as by the Gascons, it is still to some extent practised. In the early time of the middle ages the neck was protected by the camail, and the fully developed armet, following the form of the person accurately, protected the nape of the neck by a plate of steel, of which the edge fitted a groove in the gorgerin, allowing a free side-

wise movement. (See *armet*.) In the headpieces of the sixteenth century, after the abandonment of the full panoply of steel, the couvre-nuque was a large plate secured to the lower edge of the helmet behind, or more commonly a series of plates, like the tassets, moving one upon another and secured to a lining of leather or some other material by rivets.

(afterward James I. of England), and renewed in 1590 and 1596. Its object was the maintenance of the Presbyterian or Reformed religion against popery, and its particular cause was the attempt of Charles I. to force a liturgy upon Scotland. 2. In *her*., an animal represented with the tail hanging down, or turned up between the legs, as a lion or other beast of prey. Also *cow*. =Syn. 1. *Coward*, *Poltroon*, *Craven*, *Dastard*, *Pusillanimous* (person) express an ignoble quality of fear, or fear showing itself in dishonorable ways. *Coward* is the general word, covering the others, is most often used, and is least opprobrious. *Poltroon*, *craven*, and *dastard* are highly energetic words, used only in the effort to make a person's cowardice seem contemptible. The distinction between them is not clearly marked. A *poltroon* has somewhat more of the mean-spirited and contemptible in his character; a *craven* skulks away, accepts any means of escape, however dishonorable, from a dangerous position, duty, etc.; a *dastard* is base, and therefore despicable, in his cowardice. *Dastard* is the strongest of these words. A *pusillanimous* person is, literally, one of little courage; his cowardice is only the most conspicuous part of a general lack of force in mind and character, making him spiritless and contemptible.

I was a *coward* on incontinent. *Shak.*, 1 Hen. IV., II. 4.

In *entom.*, the first or basal joint (sometimes called the hip) of an insect's leg, by which it is articulated to the body. It may be entirely uncovered, as in many flies, or received into a coxal cavity or deep hollow in the lower surface of the thorax, as in most beetles. *Coxae* are said to be *contiguous* when those of a pair are close together, *separate* when there is a space between them, *distant* when they are widely separate, *prominent* when they protrude from the coxal cavities, *globose* when they are shaped like a ball, *transverse* when they lie across the body with the succeeding joint of the leg attached to the inner end, etc. These distinctions are of great value in classification. Sometimes the coxa has a small accessory piece called the *trochanter*, which, however, is not a true joint. Some of the older entomologists included the first two joints of the leg in the term *coxa*, the first being distinguished as the *patella* and the second as the *trochanter*.

They are distinguished as *anterior*, *median*, and *posterior*, and are said to be *entire* when they are completely closed behind by the junction of the sternum and epimera, *open* when a space is left protected only by membrane, *separate* when the sternum extends between them, and *confluent* when the sternum is not visible between them. Much use is made of these characters in classification.—**Coxal lines**, in *entom.*, two curved, slightly prominent lines on the first ventral abdominal segment of certain *Coleoptera*, behind the coxae. They limit a space which is inclined toward the base of the abdomen, passing under the coxae.

The latter may be circular, radial, or universal. The parts of the simple crane are an upright post having a motion on its vertical axis, a jib or swinging arm jointed at its lower end to the post and tied to the post at its outer or upper end, and hoisting tackle connecting the motive power at the foot of the post with the load to be lifted, which is suspended from the end of the jib. Cranes are, however, made in a variety of forms, differing more or less from this type. Thus, a *rotary crane* is a crane in which the jib has simply a rotary motion about the axis of the post, moving with the post; a *traveling crane* is a crane in which the load can be given successively two horizontal motions at right angles with each other. Rotary cranes, again, have several forms, as that in which the load is suspended from the end of the

jib, and the more complex kind, in which the load is suspended from a carriage that travels on a horizontal arm at the top of the jib, and gives the load a movement along the radius of the circle formed by the rotation of the jib. Another minor type is the *derrick-crane*, which employs guys to hold the post in position. *Walking and locomotive cranes* are portable forms, which are also called *traveling cranes*. Cranes are operated by any kind of power and with any form of hoisting apparatus suited to the work to be done. See also cut under *abutment-crane*.

plane of the occipital foramen forms with the plane of the basilar groove; the *coronofacial angle* of Gratiolet, the angle which the facial line of Camper forms with the plane passing through the coronal suture; the *facial angle* of Camper, the angle between the facial line of Camper (1 1) and the line (7 7) drawn through the auricular and subnasal points; the *facial angle* of Cloquet, the angle between the line drawn through the ophryon and the alveolar point and the auriculo-alveolar line (9 9)—that is, the angle *TAC*; the *facial angle* of Geoffroy Saint-Hilaire, the angle *BDX*, between the basion and the line (10 10) drawn through the auricular point and the edge of the incisors; the *facial angle* of Jacquart, the angle between the line drawn through the subnasal point and the glabella and the line (7 7) drawn through the subnasal and auricular points; the *frontal angle*, the angle *TCE*, formed by lines drawn from the auricular point (C) (that is, the projection of the auricular points on the median plane) to the ophryon (T) and to the bregma (E); the *metafacial angle* of Serres, the angle which the pterygoid processes form with the base of the skull; the *nasobasilar angle* of Welcker, the angle *RXD*, between the nasobasilar and naso-subnasal lines; the *occipital angle* of Broca, the angle *RUD*, or that between the lines drawn from the opisthion (U) to the basion and nasal points; the *occipital angle* of Daubenton, the angle which the line of Daubenton (2 2) makes with the line joining the basion (D) and opisthion (U); the *parietal angle*, the angle formed by the two lines *ZS* and *Z'S* (fig. 2) drawn through the extremities of the transverse maximum or bizygomatic diameter and the maximum transverse frontal diameter (it is called *positive* when it opens downward, *negative* when the lines meet below the skull and it opens upward); the *angles of Segond*, angles formed between lines drawn from the basion (D) to the various other craniometrical points, the *facial angle* of Segond being the angle *PDT*, or that between the line passing through the basion (D) and mental point (P) and the line passing through the basion (D) and ophryon (T), and the *cerebral angle* of Segond being the angle *UDT*, or that between the line passing through the basion (D) and ophryon (T) and the line passing through the basion (D) and opisthion (U); the *sphenoidal angle*, the angle between the line drawn from the basion and nasion to a point in the median line where the sloping anterior surface of the sella turcica passes over into the horizontal surface of the olivary eminence; the *symphysian angle*, the angle which the profile of the symphysis of the lower jaw makes with the plane of the inferior border of the lower jaw; and the *total cranial angle*, the angle *UCT*, measuring the cranial cavity, between lines drawn from the auricular point to the ophryon and to the opisthion. crank² (krangk), *n.* [< ME. *cranke*; perhaps < AS. **cranc*, in comp. **cranc-staf*, an unauthenticated form in Somner, defined as "some kind of weavers instrument"; appar. < *crank¹*, *a.*, bent, crooked, which is, however, not recorded in ME. or AS.: see *crank¹*, *a.*] 1. A bent or vertical arm attached to or projecting at an angle from an axis at one end, and with provision for the application of power at the other, used for communicating circular motion, as in a grindstone, or for changing circular into reciprocating motion, as in a saw-mill, or reciprocating into circular motion, as in a steam-engine. The single *crank* (1) can be used only on the end of an axis. The double *crank* (2) is employed when it is necessary that the axis should be extended on both sides of the point at which the reciprocating motion is applied. An exemplification of this arrangement is afforded by the machinery of steam-vessels. The *bell-crank* (3), so called from its ordinary use in bell-hanging, performs a function totally different from that of the others, being used merely to change the direction of a reciprocating motion, as from a horizontal to a vertical line.

The Constellation Crater.—From Ptolemy's description.

(See *steinkirk*.) The modern cravat is rather a necktie, passed once round the neck, and tied in front in a bow, or, as about 1840 and earlier (when the cravat consisted of a triangular silk kerchief, usually black), twice round the neck, in imitation of the stock. Formerly, when starched linen cravats were worn, perfection in the art of tying them was one of the great accomplishments of a dandy. The cravat differs properly from the scarf, which, whether tied, or passed through a ring, or held by a pin, hangs down over the shirt-front. In England *neckcloth* is the usual word in this sense.

Such associations are of two kinds: (a) Those in which the association lends money on real estate at a fixed rate of interest, and issues stock based on the property thus pledged, promising to pay a fixed rate of interest thereon. The stock may be bought by any person. The purchaser, in effect, buys the stock on the promise of the borrower coupled with the pledge of his property, and on the further promise of the association. This form is common in Germany. (b) Those in which the loan is repaid by instalments or annuities extending over a period of years, generally fifty. Associations of this kind are common in France.

Crédit Mobilier (kred'it mö-bë-liër; *F. pron.* Krä-dë' mö-bë-lyä'), [*F.*, lit. personal credit: *crédit*, credit; *mobilier*, personal (of property), <

mobile, movable: see *credit*, *n.*, and *mobile*.] 1. In *French hist.*, a banking corporation formed in 1852, under the name of the "Société générale du Crédit Mobilier," with a capital of 60,000,000 francs, for the placing of loans, handling the stocks of all other companies, and the transaction of a general banking business. It engaged in very extensive transactions, buying, selling, and loaning in such a manner as to bring into one organized whole all the stocks and credit of France, and was apparently in a most prosperous condition until it proposed to issue bonds to the amount of 240,000,000 francs. This amount of paper currency frightened financiers, and the government forbade its issue. From this time the company rapidly declined, and closed its affairs in 1867, with great loss to all but its proprietors.

2. In *U. S. hist.*, a similar corporation chartered in Pennsylvania in 1863 with a capital of \$2,500,000. In 1867, after passing into new hands, and increasing its stock to \$3,750,000, it became a company for the building of the Union Pacific railroad. For a few years it paid large dividends, and its stock rose in value. In a trial in Pennsylvania in 1872 as to the ownership of some stock, it was shown that certain congressmen secretly possessed stock, and both houses of the Congress that met in December of that year appointed committees of investigation. The Senate committee recommended the expulsion of one member; but the Senate did nothing. The House committee recommended the expulsion of two of its members; but the House, instead, passed resolutions of censure.

creed (krəd), *n.* [*ME. crede* (sometimes, as *L. credo*), < *AS. crēda* = *Icel. kredda* (also, after *L. credo*) = *MHG. crēde* (cf. *Gael. crē*); in other languages usually in *L. form*, *OF. F. Pr. Sp. Pg. It. credo*, creed; < *L. credo*, I believe, the first word of the Latin version of the Apostles' and Nicene creeds; 1st pers. sing. pres. ind. act. of *credere*, believe, trust, confide: see *credit*, *v.*] 1. A statement of belief on any subject, religious, political, scientific, or other; especially, a formal statement of religious belief; a "form of words, setting forth with authority certain articles of belief which are regarded by the framers as necessary for salvation, or at least for the well-being of the Christian Church" (*Schaff*, *The Creeds of Christendom*, I. i.). In the Protestant churches the authority of creeds is relative and limited, and always subordinate to the Bible as the only infallible rule of faith and practice. In the Greek and Roman Catholic churches the creed of the church is regarded as of equal authority over the believer with the Bible. The principal historical creeds of Christendom are the following: the *Apostles' Creed* (see *Apostle*) and the *Nicene Creed* (see *Nicene*), both originating in the fourth century, and generally accepted by Christian churches, Protestant, Greek, and Roman Catholic; the *Athanasian Creed* (see *Athanasian*), retained by the Church of England, but not by the Protestant Episcopal Church in the United States, nor by other Protestant communities; the *Decrees of the Council of Trent* (A. D. 1563), the great symbol of Romanism (see *Tridentine*); the *Orthodox Confession of Mogilas* (seventeenth century), and the creed ratified by the Synod of Jerusalem (1672), both recognized by the Greek Church; the *Augsburg Confession* (1530), the symbol of the Lutheran Church; the *Helvetic Confessions* (two confessions, a first and a second Helvetic Confession, 1536, 1566), adopted by Swiss theologians as a statement of the reformed faith of the Swiss churches; the *Westminster Confession of Faith* (1647), the symbol of the Presbyterian Church; the *Canons of the Synod of Dort* (1619), aimed especially at Arminianism, and still regarded as a symbol of doctrine by the Reformed Church of the Netherlands and the Reformed (Dutch) Church in America; the *Thirty-nine Articles* (1563-71) of the Church of England (and revised in 1801) of the Protestant Episcopal Church in the United States; the *Savoy Confession* (1658), a Congregational symbol, and formerly generally accepted by Congregationalists; and the *Twenty-five Articles of the Methodist Episcopal Church* (1784), of which the first twenty-four were prepared by John Wesley, on the basis of the Thirty-nine Articles of the Church of England. A number of other special declarations of faith by other Protestant bodies are of less historical significance. The word *creed*, however, in its strict sense applies only to comparatively brief formulas of profession of faith (as the Apostles' Creed), beginning with the words "I believe" or "We believe," and intended to be used at baptism or reception of converts, or in public worship.

Also wher the Postylls [Apostles] made *Crede* of over feyth.

The revival of the practice in a more efficient manner has been advocated in recent times for sanitary reasons, and to some extent effected. Siemens's apparatus (a modification of the plan of Sir Henry Thompson) the body is exposed to the combined action of highly heated air and combustible gases, so as to be entirely consumed without foreign admixture, while the furnace is so constructed that no noxious effluvia escapes from it.

Crests proper belong to the top of the head, but may be also held to include such growths on its side. . . . *Crests* may be divided into two kinds: 1, where the feathers are simply lengthened or otherwise enlarged; and 2, where the texture, and sometimes even the structure, is altered. Nearly all birds possess the power of moving and elevating the feathers on the head, simulating a slight crest in moments of excitement. *Cones*, Key to N. A. Birds, p. 99.

2. Anything resembling, suggestive of, or occupying the same relative position as a crest. (a) An article of dress or ornament; specifically, in *armor*, an upright ornament of a helmet, especially when not long and floating like a plume of feathers or a coif, as a ridge of metal, hair, bristles, feathers, or the like. Crests of diverse forms were used on ancient helmets, and have been more or less closely imitated in the various forms of crest affixed to the helmets of some modern mounted troops, etc. Stiff crests of hair or feathers were often worn by knights in the middle ages. (Compare *aigret*.) The crest in medieval armor was early affected by heraldic considerations (see (b)), whether formally, as being the heraldic crest itself, or by the necessity of using a badge or cognizance, whether temporary or permanent: thus, the tilting-helmet was often surmounted by an elaborate structure in cuir-bouilli or even in thin metal, representing an animal or the head of an animal, or a human figure.
